Technical University of Denmark

### **Understanding cancer genomics**

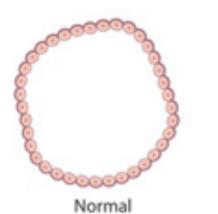

Adrian Otamendi Laspiur, Research Assistant (iCOPE) Original slides: Jose MG Izarzugaza

**DTU Bioinformatics** Department of Bio and Health Informatics

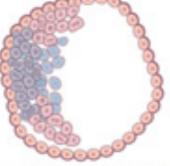

# What is cancer?

### The disease caused by an uncontrolled division of *abnormal* cells in a part of the body

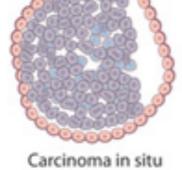

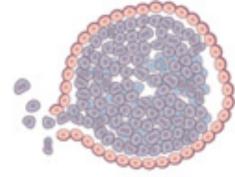

Hyperplasia

Atypical hyperplasia

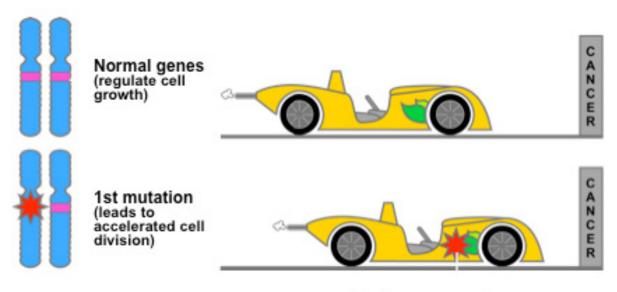

Microinvasive

# Need for speed: Oncogenes vs Tumour suppressors

### **Oncogenes**:

- Mutated proto-oncogenes
- Turn abnormal cell growth on
- 70 protooncogenes
- gain of function genes
- primarily somatic activated
- [throttle pedal in a car]

Proto-oncogene to oncogene

"Oncogenes are mutated genes whose PRESENCE can stimulate the development of cancer"

### Examples: HER-2/neu. RAS, MYC, SRC, hTERT

RAS, MYC, SRC are protein kinases  $\rightarrow$  Cell cycle regulation

(Adapted from Nat. Cancer Inst.)

# Need for speed: Oncogenes vs Tumour suppressors

# Tumour suppressor genes: Stop the cell cycle, G1 phase Slow the cell cycle before S phase Can induce apoptosis Primarily somatic de-activated loss-of-function mutations

- [brake pedal in a car]

"Tumour suppressors are normal genes whose ABSENCE can stimulate the development of cancer"

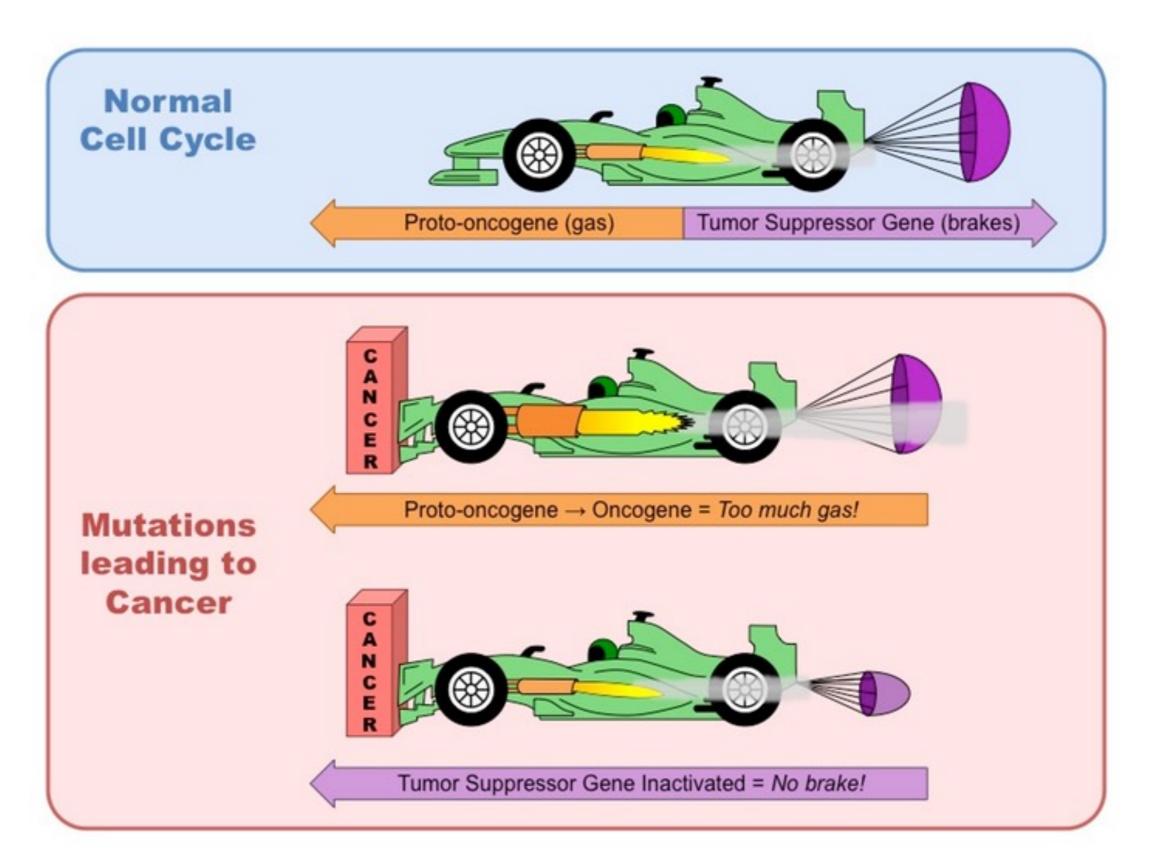

Examples: p53, Rb, APC

Sometimes, a single functional copy (heterozygous) is enough to prevent cancer

(Adapted from Nat. Cancer Inst.)

# Need for speed: Oncogenes vs Tumour suppressors

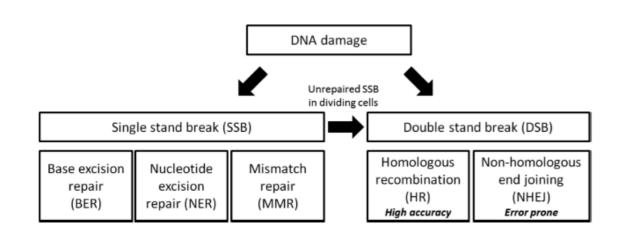

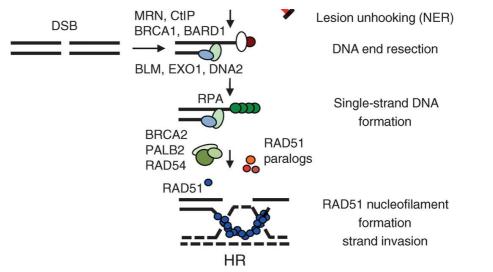

# Need for speed: DNA repair genes

### DNA damage repair genes

- Correct damage during DNA duplication
- Active in cell cycle, primarily G2
- After DNA replication, before Chr divides

loss-of-function mutations → increased mutation burden
 Examples: BRCA1 and BRCA2 in breast cancer
 Also, mDDRG in hereditary colon cancer

### (Adapted from Nat. Cancer Inst.)

### The hallmarks of cancer

Vascularization

Secondary tumour

### Acquire functional capabilities

- Sustaining proliferative signaling
- Evading growth suppressors
- Resisting cell death
- Enabling replicative immortality
- Inducing angiogenesis
- Activating invasion and metastasis
- Emerging Hallmarks

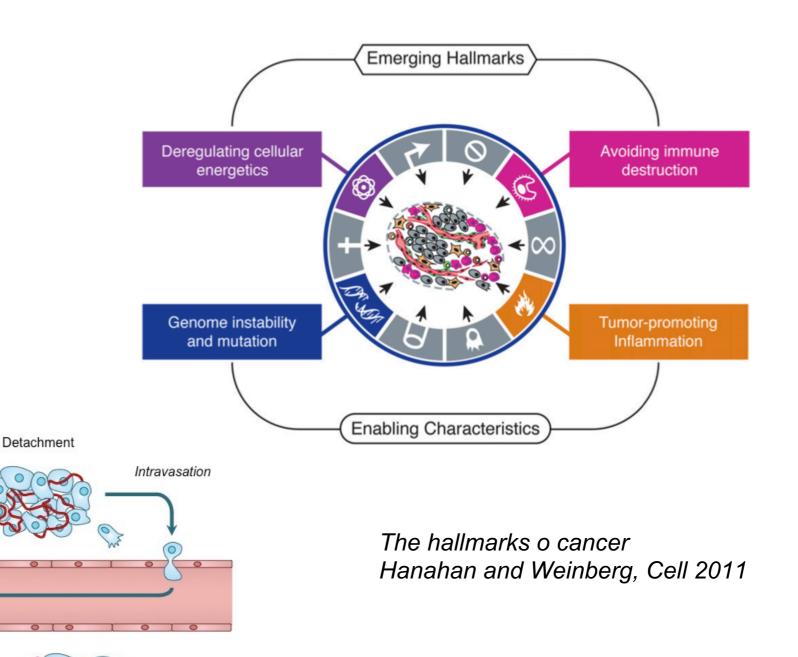

Primary tumour

Invasion

Mutation

Extravasation

• Enabling characteristics

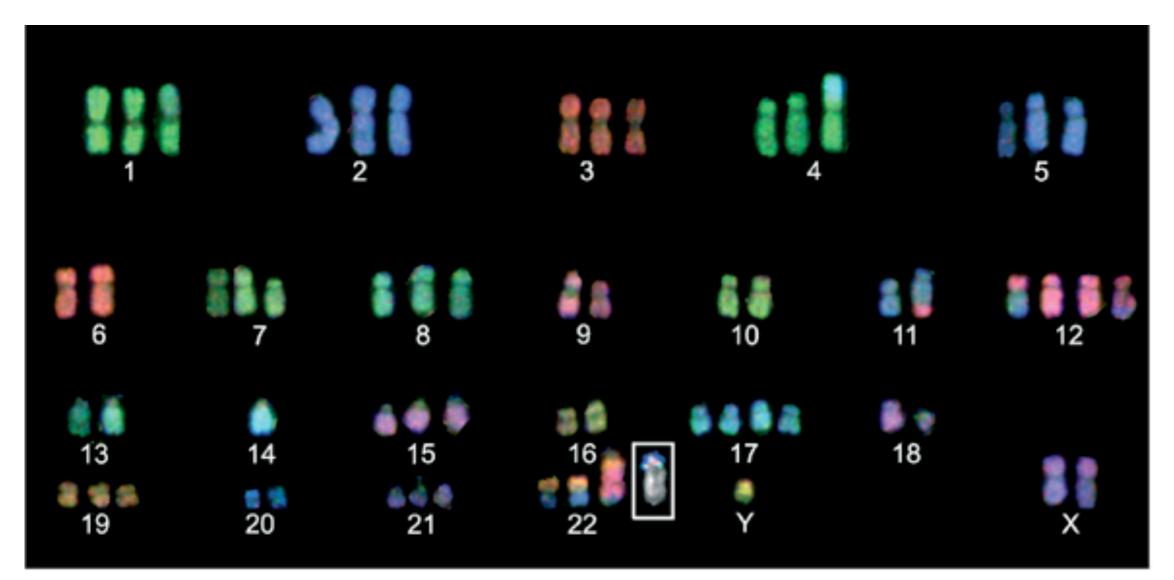

### (ib.bioninja.com.au)

Vascularization

### What is cancer?

### Cancer is a genetic disease: chromosomal aberrations

Spectral karyotyping

Chromosomal gain, loss Translocation, inversion Focal amplification

# What is cancer?

Cancer is a genetic disease: point mutations

Substitution Insertion Deletion

### **KRAS-wt**

ATGACTGAATATAAACTTGTGGTAGTTGGAGCT<mark>GGT</mark>GGCGTAGGCAAG...

-M--T--E--Y--K--L--V--V--G--A-**-G**--G--V--G--K-...

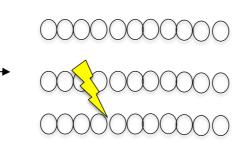

### **KRAS-G12D**

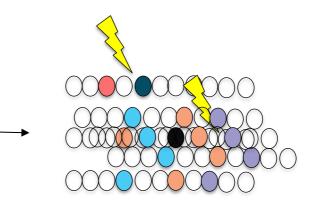

ATGACTGAATATAAACTTGTGGTAGTTGGAGCT -M--T--E--Y--K--L--V--V--G--A--D-G--V--G--K-...

- Frequent driver mutation for tumors of the lung, colon, etc.
- Predicts lack of benefit from EGFR inhibitors

# The drivers and passengers

Cancer

Normal tissue

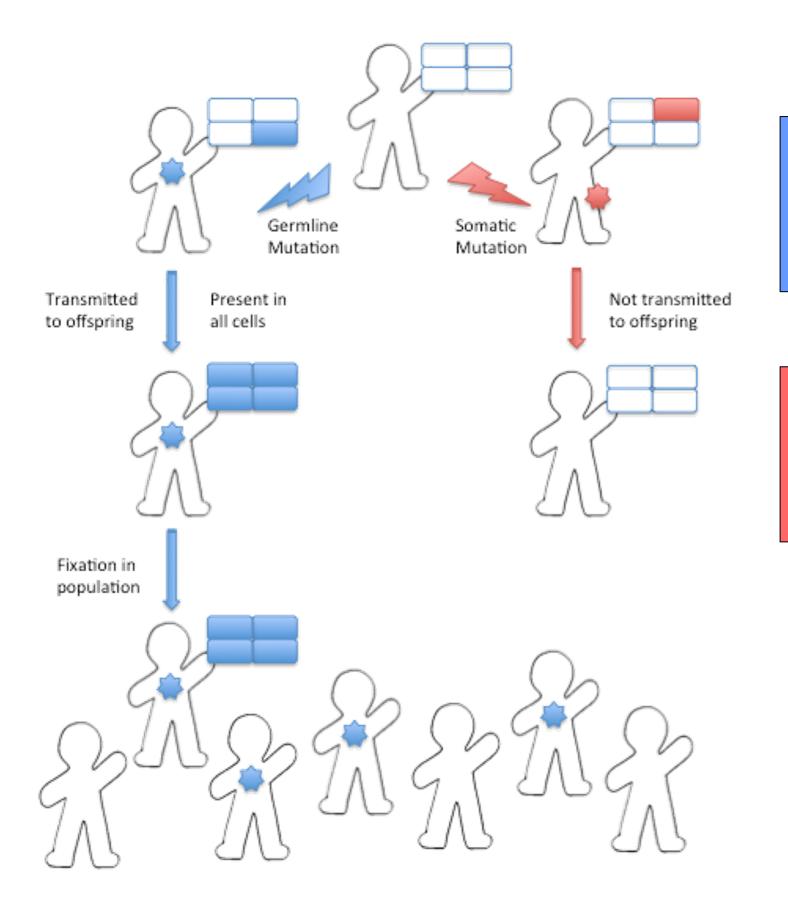

### Mutation

Driver mutation
 Passenger mutations

Driver → Confers selective advantage Disease associated, pathogenic Passenger → Present in the clonal progenitor

### Germline vs Somatic mutations

Germline Mutations Present in all cells Transmitted to offspring Fixate in population (SNP)

Somatic Mutations -Present only in some cells -Not transmitted to offspring -Do not fixate in population

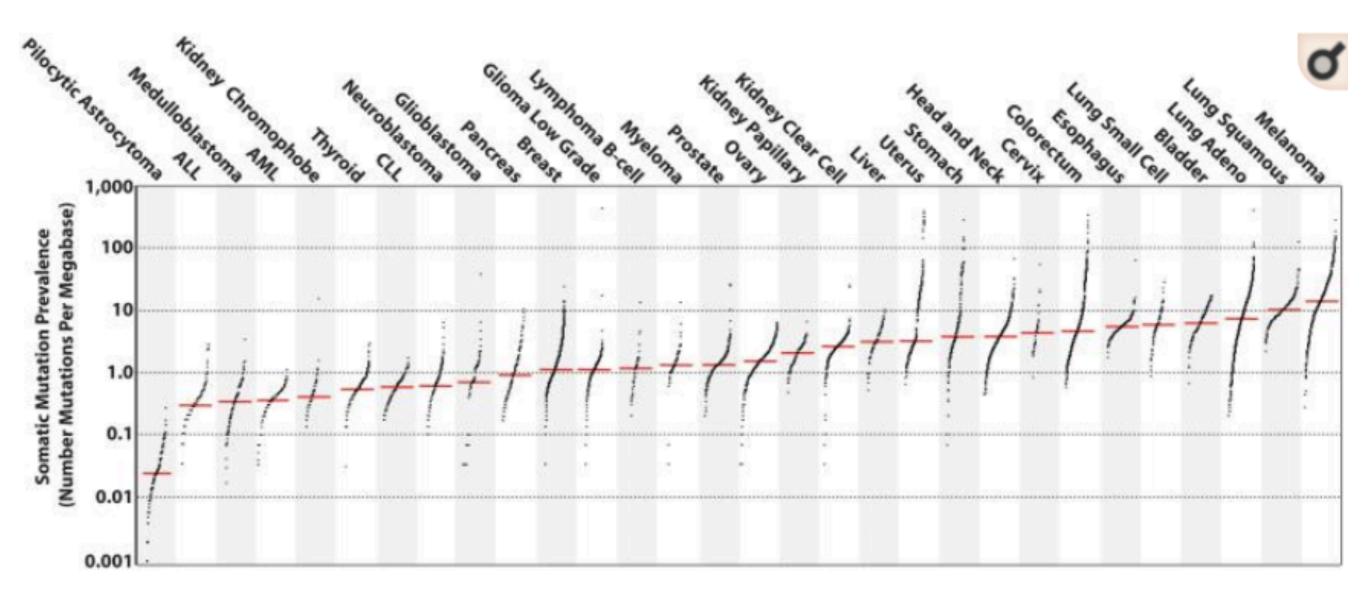

### "Cancer is not a single disease, but rather 150+ different diseases."

*Prof. Dr. Mariano Barbacid, former director of the Spanish National Cancer Research Center and discoverer of the first oncogene, RAS.* 

### Number of somatic mutations in different cancer types

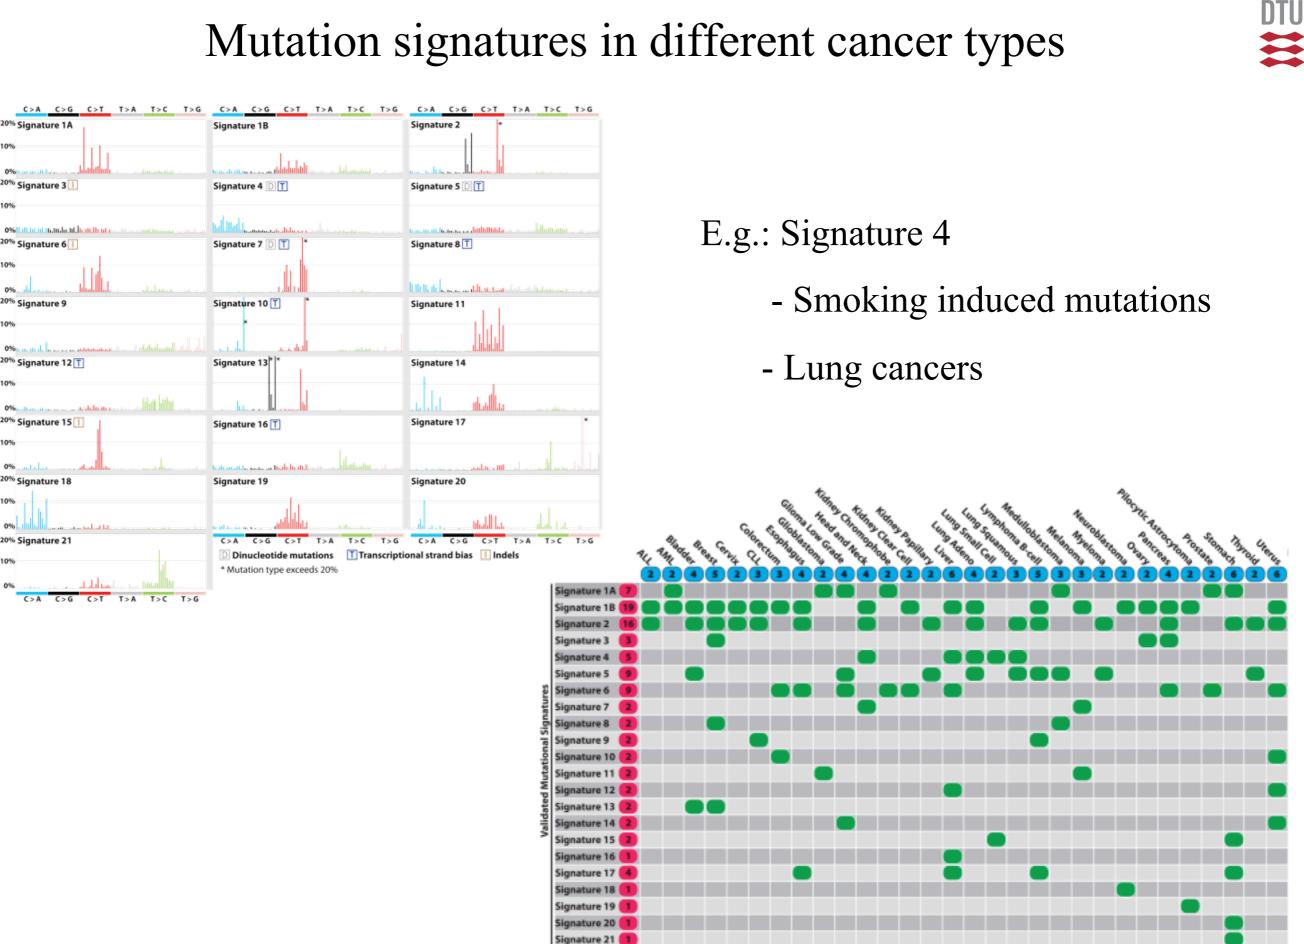

### Signatures of mutational processes in human cancer

# DTU

### For the researcher:

- Identify recurrent mutations that represent druggable targets
- Identify specific mutations or patterns that predict benefit from specific drugs
  - Study the evolutionary process -- mutation, selection

### For the cancer patient:

Identify "actionable" mutations - inform treatment decisions Aid in diagnosis

# Characterising a tumour specimen

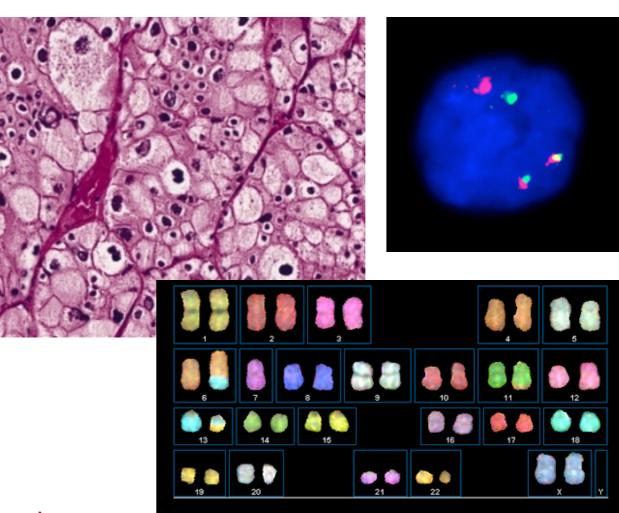

### Measured in individual cells:

- Cellular/tissue morphology
- Protein expression
- Gene copy number (FISH)
- Karyotype

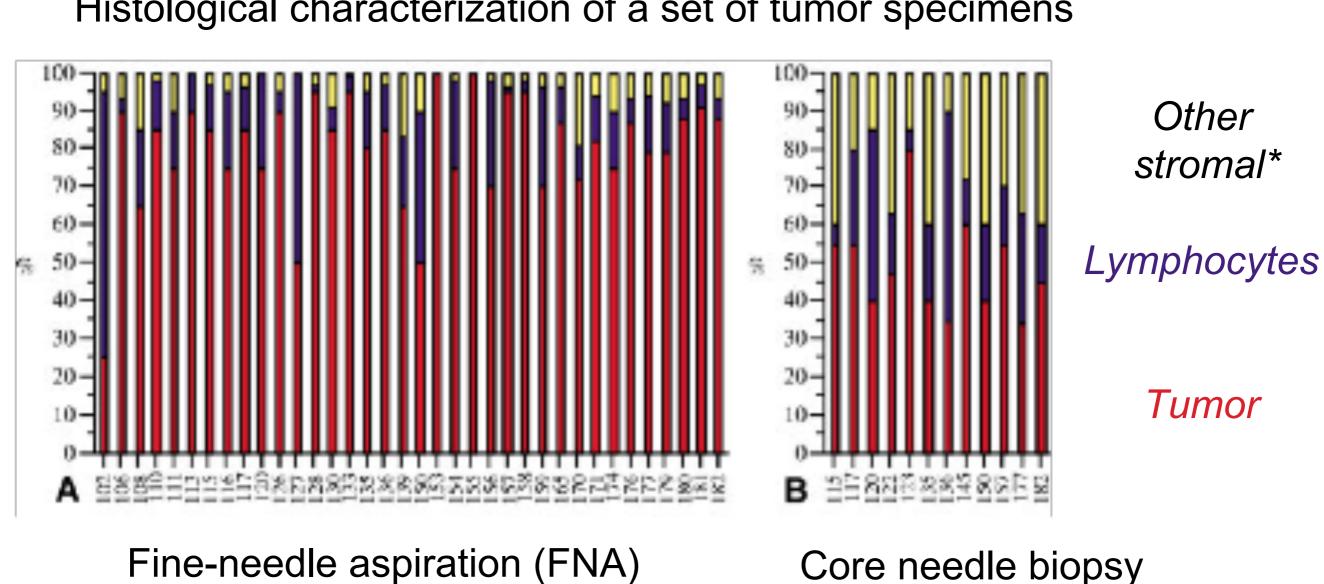

- Gene expression (from microarray)
- Copy number profile (from SNP array)
- WES/WGS/RNA-seq

Bulk tissue includes non-tumor cells!

# Caution 1: Tumour specimens are not just tumour cells

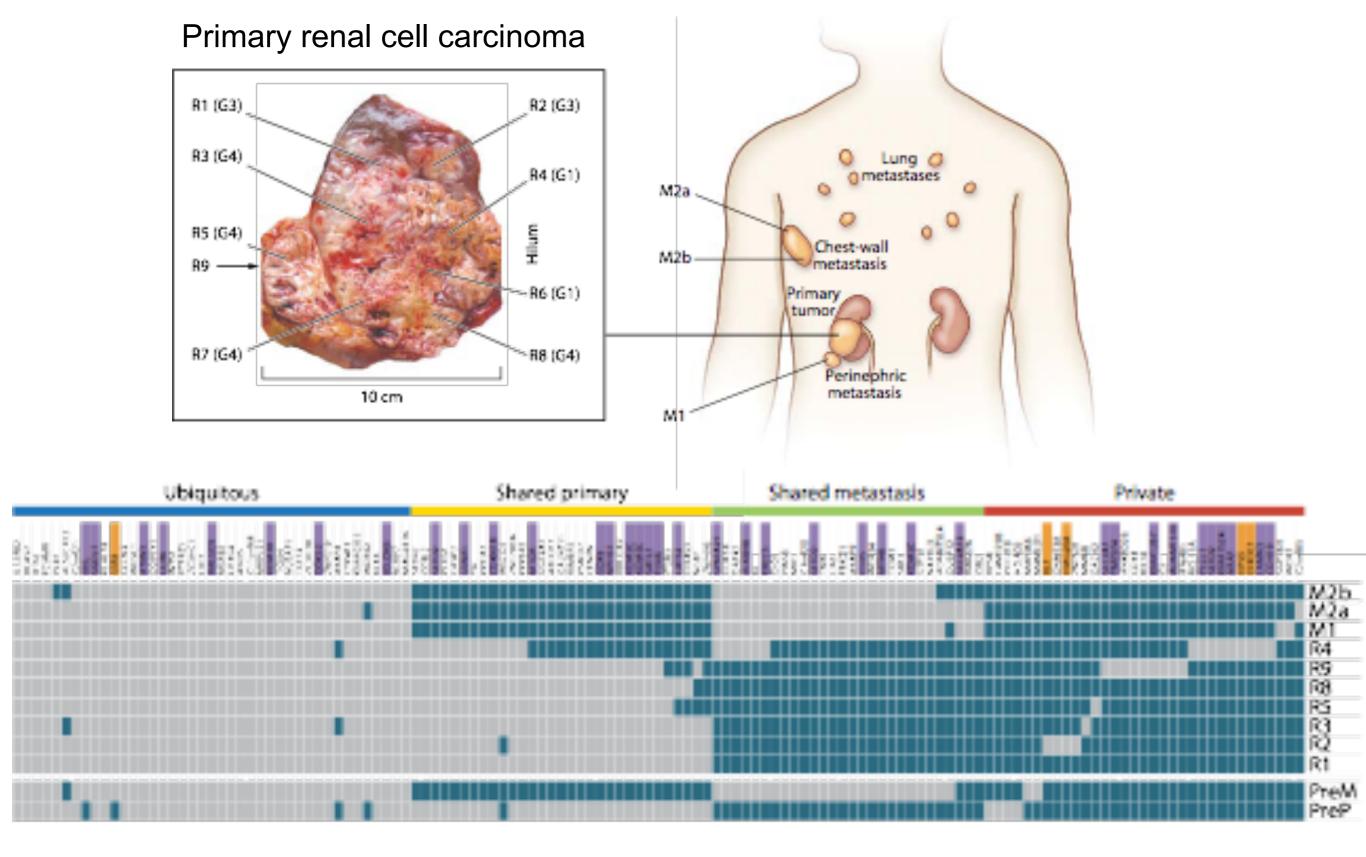

Histological characterization of a set of tumor specimens

\* Other stromal = fibroblasts, endothelials, histocytes, adipocytes

# Caution 2: Tumour heterogeneity

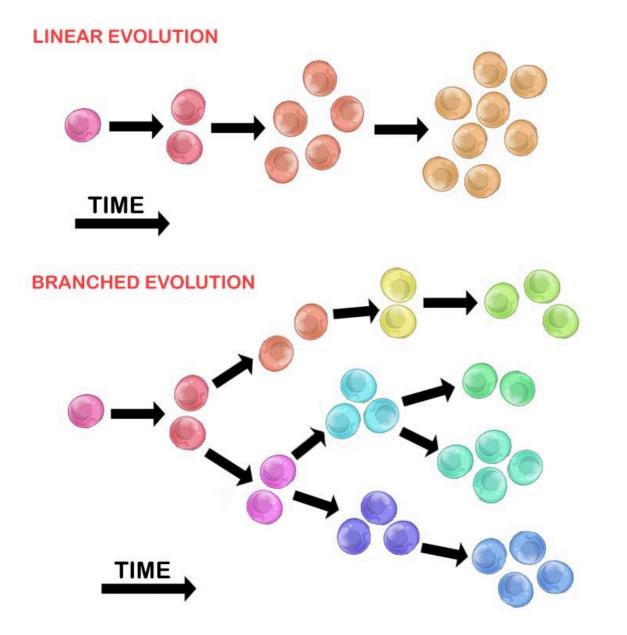

Gerlinger et al. (2012) NEJM

# Caution 2: Tumour heterogeneity

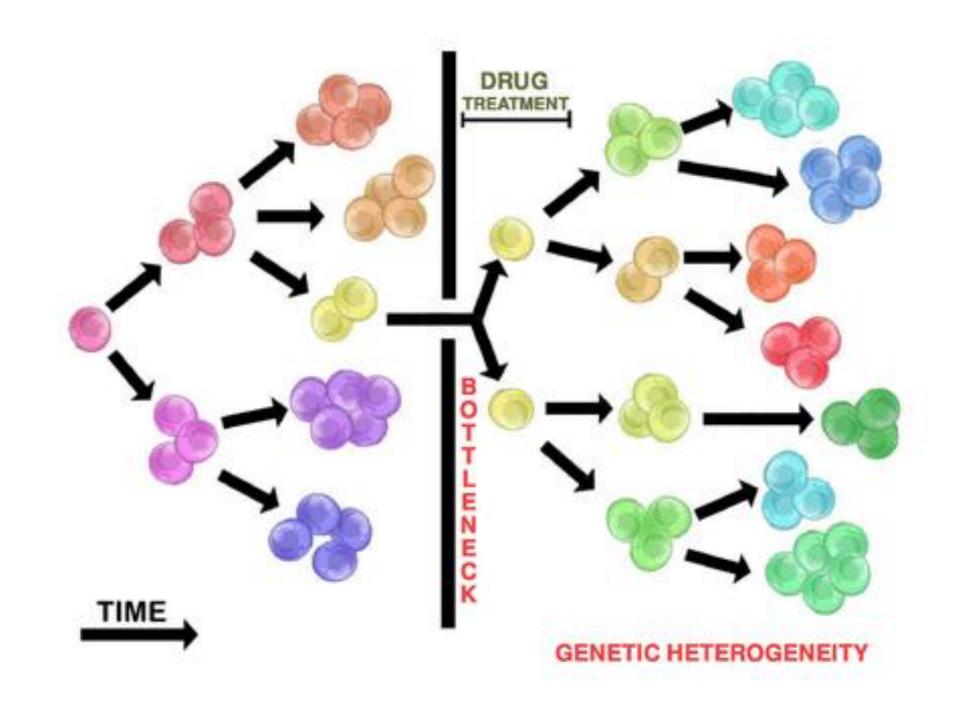

- Tumour heterogeneity → differential
   subclonal evolution
- Clones accumulate different mutations as they diverge.

# Treatment can re-shape tumour heterogeneity

DTU

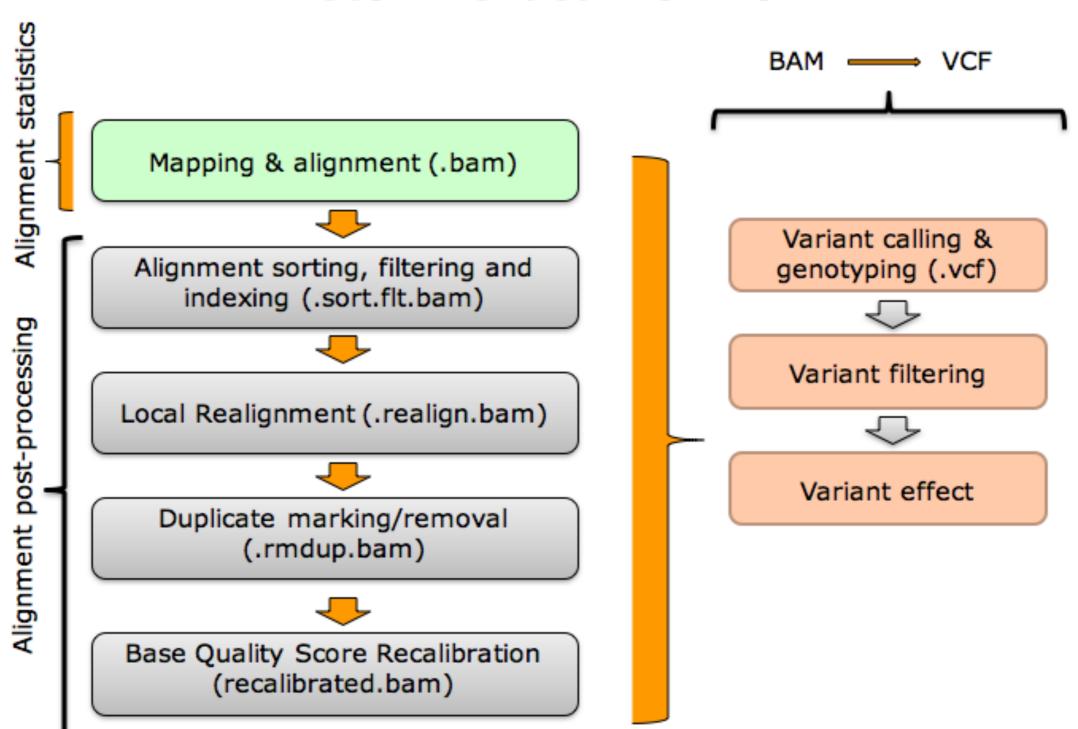

Ħ

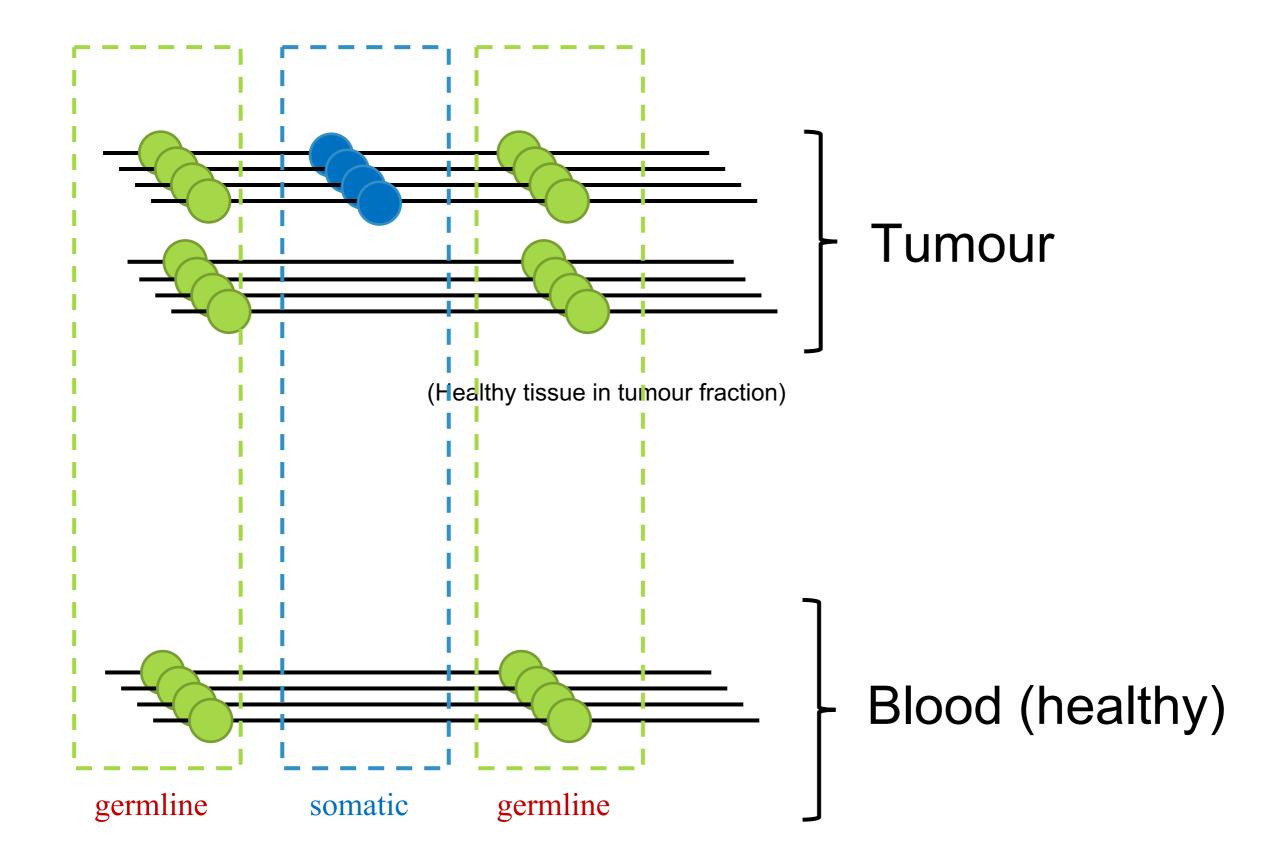

# How to identify somatic mutations in a tumor

# Variant calling pipeline

### **Recommended workflow<sup>1</sup>**

### Matched samples for variant calling

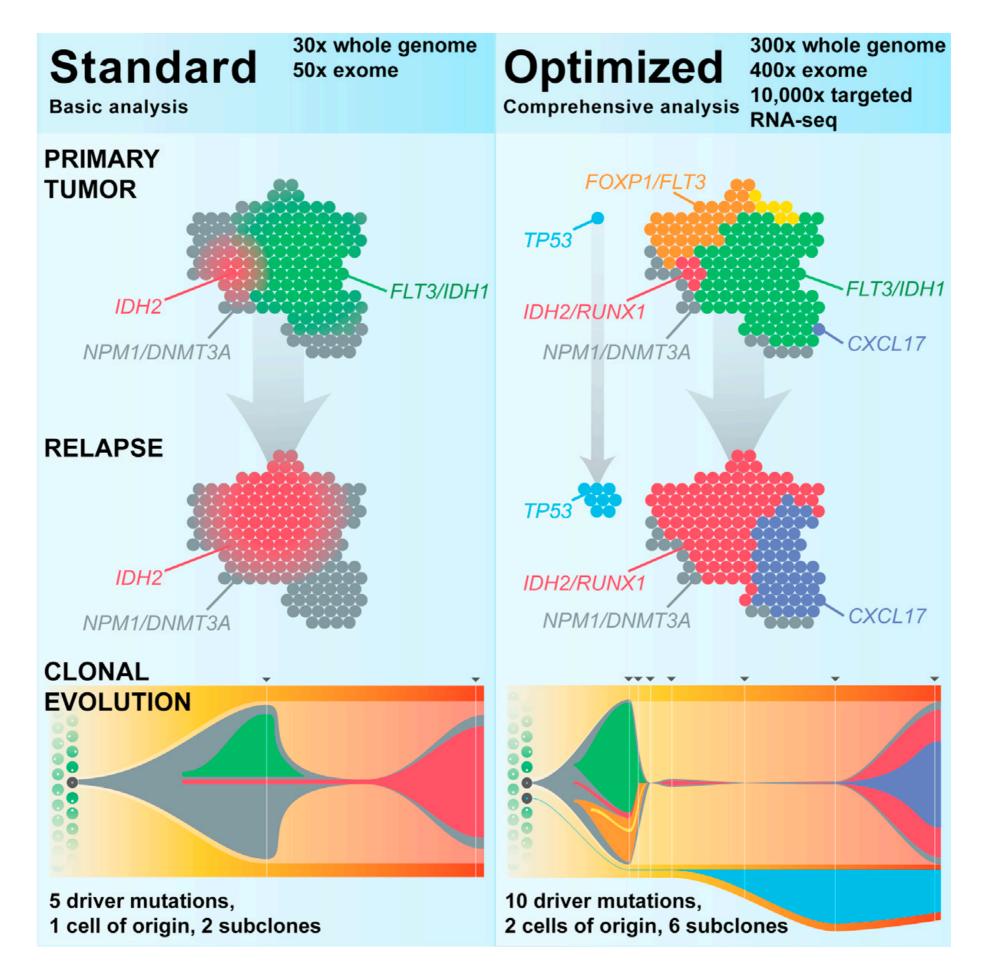

# Somatic mutation calling vs. "regular" variant calling

1. We are interested in somatic mutations: differences between the **tumor genome and the normal genome** (NOT the reference genome).

2. The tumor data represents a **mixture** of reads from tumor cells and from normal cells, so we need **deeper sequencing** and **more sensitive analysis** to detect variants.

3. Tumors are often heterogeneous, and relevant mutations may be present at low allelic frequency. So we need **even deeper** sequencing.

Also: we are often interested in copy number changes, translocations, and clonal architecture

M. Griffith et al., Cell Systems (2015)

# Cancer gene panel amplicon sequencing

TruSeq Amplicon - Cancer Panel Gene List

ABL1	EGFR	GNAS	MLH1	RET
AKT1	ERBB2	HNF1A	MPL	SMAD4
ALK	ERBB4	HRAS	NOTCH1	SMARCB1
APC	FBXW7	IDH1	NPM1	SMO

### **Ensembl Variant Effect Predictor (I)**

### **()** Variant Effect Predictor:

This tool takes a list of variant positions and alleles, and predicts the effects of each of these on overlapping transcripts and regulatory regions annotated in Ensembl. The tool accepts substitutions, insertions and deletions as input, see <u>data formats</u>.

Upload is limited to 750 variants; lines after the limit will be ignored. Users with more than 750 variations can split files into smaller chunks, use the standalone perl script or the variation API. See also full documentation

NB: Ensembl now by default uses Sequence Ontology terms to describe variation consequences. See this page for details

### Input file

Species:	Human (Homo sapiens): GRCh: 🗘
Name for this data (optional):	
Paste data:	1 881907 881906 -/C + 5 140532 140532 T/C +
Upload file:	Choose File No file chosen
or provide file URL:	
Input file format:	VCF 🗘

### **Ensembl Variant Effect Predictor (II)**

### **Options**

Transcript database to use:

Get regulatory region consequences (human and mouse only):

Type of consequences to display:

Check for existing co-located variants:

Get 1000 Genomes global allele frequency for existing variants:

Return results for variants in coding regions only:

Show HGNC identifier for genes where available:

Show Ensembl protein identifiers where available:

Show HGVS identifiers for variants where available:

### Missense SNP predictions (human only)

SIFT predictions:

**PolyPhen predictions:** 

### Frequency filtering of existing variants (human only)

requency intering of existing variants (numarionly)	
Filter variants by frequency:	
	<b>NB:</b> Enabling frequency filtering may be slow for large datasets. The default options will filter out common variants found by the 1000 Genomes project.
Filter: Exclude \$ variants with MAF greater than \$ 0.01 (in	1000 genomes (1KG) combined population 💲

Shown are 75 amino acids surrounding the mutation position (marked with a black box). An interactive version of the complete alignment is also available.

# Automatic methods to predict the pathogenicity of mutations

SNAP				SIFT				
SNAP: predict effect of non- polymorphisms on function	-synor	21	edicting Delete line C. Ng and Steven H	rious Amino Acid Substitutions				
Yana Bromberg <sup>1,2,4,*</sup> and Burkhard Rost <sup>1,2,3</sup>			SNPs&GO					
Polyphen-2			Functional Annotations Improve the Predictive Score of Human Disease-Related Mutations in Proteins					
A method and server for predicting damagin mutations	ng misse	Remo	Remo Calabrese, Emidio Capriotti, Piero Fariselli, Pier Luigi Martelli, and Rita Casadio*					
Ivan A. Adzhubei, <sup>1,7</sup> Steffen Schmidt, <sup>2,7</sup> Leonid Pesh Ramensky, <sup>4</sup> Anna Gerasimova, <sup>5</sup> Peer Bork, <sup>6</sup> Alexey and Shamil R. Sunyaev <sup>1</sup>			PMUT					
		T: a web-based tool for the annotation of pathological						
MutationAssessor	Carles F Xavier c	Ferrer- de la C	ruz <sup>1,4</sup> and Modesto	Gelpí <sup>1,2,*</sup> , Leire Zamakola <sup>1,3</sup> , Ivan Parraga <sup>1,3</sup> , Orozco <sup>1,2,3,*</sup>				
Predicting the functional mutations: application t Boris Reva*, Yevgeniv Antipin* and Chr	o ca	nce		Torkamani				
	dictio	n of		orotein kinase polymorphisms				

Some of the (many) methods implemented during the last decade
