

Brief refresher on conditional probabilities and the Bayesian theorem

Gabriel Renaud Associate Professor Section of Bioinformatics Technical University of Denmark gabriel.reno@gmail.com

Brief probability reminder ... but first a little game!

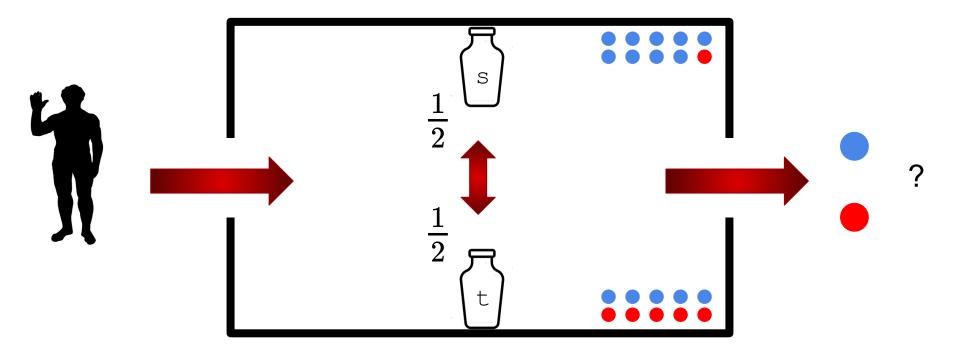

Brief probability reminder

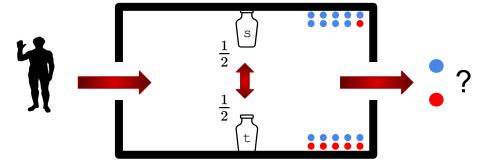

Events: *E* = our player picked a red ball

$$P(E) = \frac{1}{10} = 0.1$$

Brief probability reminder

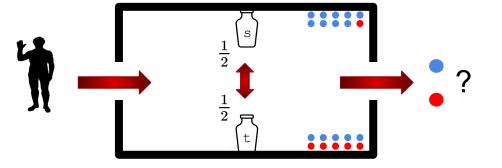

- E = S =
 - = our player picked a red ball

= our player picked the 's' urn

$$P(S)$$
 = $rac{1}{2}$
 $P(E|S)$ = $rac{1}{10}$ = 0.1

conditional probability (assuming our player picked the 's' urn)

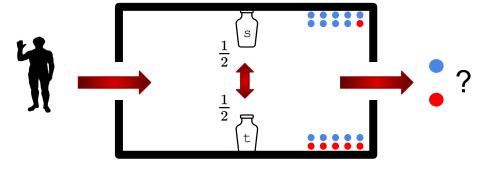

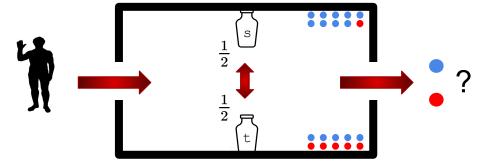

- H = our player picked a red ball
 - = our player picked the 's' urn
- T = our player picked the 't' urnP(T) = $rac{1}{2}$ P(E|T) = $rac{5}{10} = rac{1}{2} = 0.5$

S

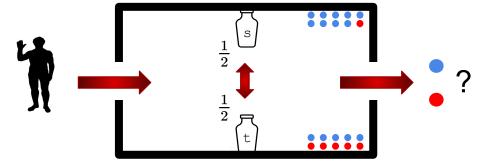

P(E) = P(S)P(E|S) + P(T)P(E|T)

$\mathcal{F}(E) = ($ Our player picked urn 's' and picked a red ball) + (Our player picked urn 't' and picked a red ball)

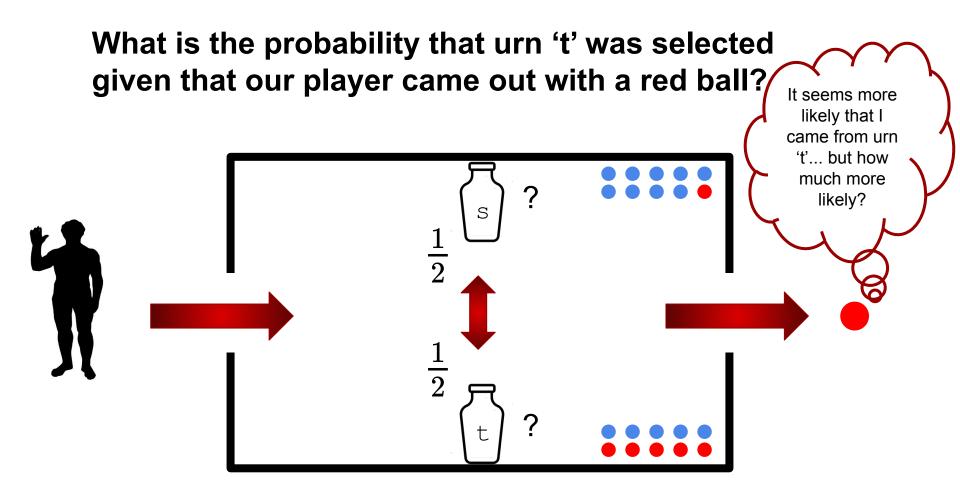

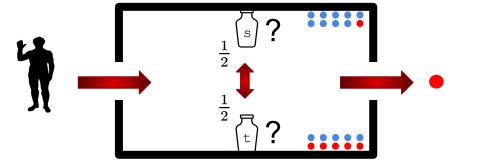

P(E) = P(S)P(E|S) + P(T)P(E|T)P(E) =5 $\frac{1}{2}$ 10 2 $\frac{5}{20}$ $\frac{1}{20}$ P(E) $=\frac{6}{20}$ P(E)

$P(E) = \frac{6}{20}$

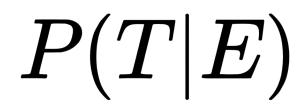

There is a 30% chance of getting a red ball

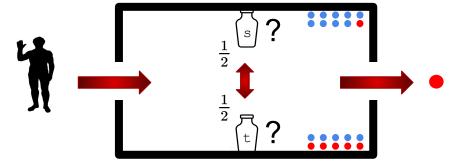

- = our player
 - = our player picked a red ball
 - = our player picked the 't' urn

We seek:

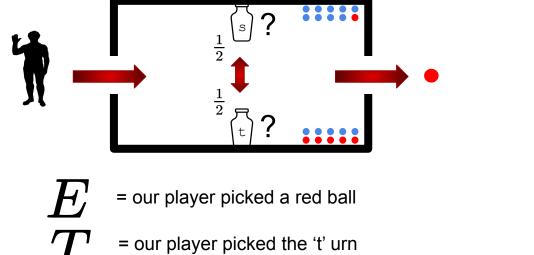

- $E \\ T$
- = our player picked a red ball
- = our player picked the 't' urn

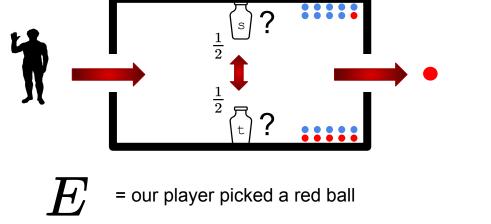

Thomas Bayes (1701 - 1761)

P(T)P(E|T)P(T|E) = -P(E)

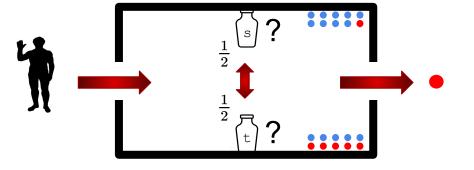

What is the **prior** probability of picking urn 't'? P(E|T)(1 P(T|E)E)

= our player picked the 't' urn

What is the **prior** probability of selecting urn 't'? E|T)P(T|E) $\mathbf{2}$ E

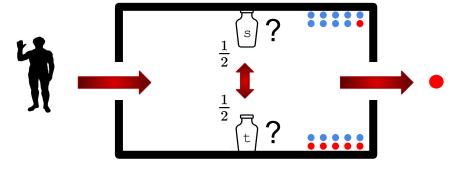

- $E \ T$
- = our player picked a red ball
- = our player picked the 't' urn

P(T|E)

What is the probability of sampling a red ball given than I selected the urn 't'?

E

2

- $E \\ T$
- = our player picked a red ball
- = our player picked the 't' urn

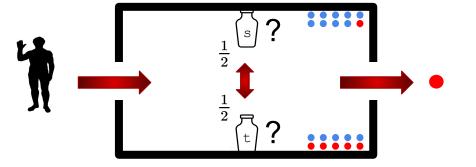

P(T|E)

What is the probability of sampling a red ball given than I selected the urn 't'?

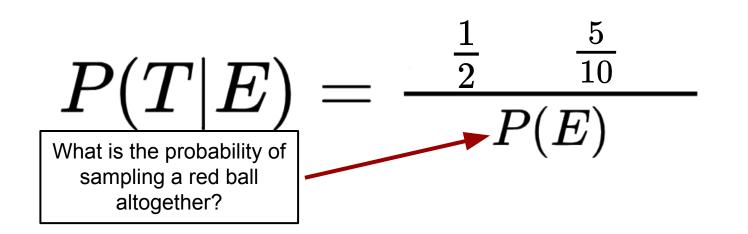

5

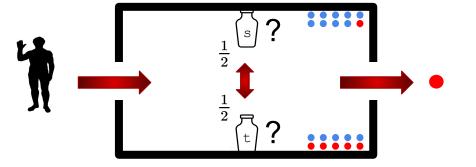

10

E

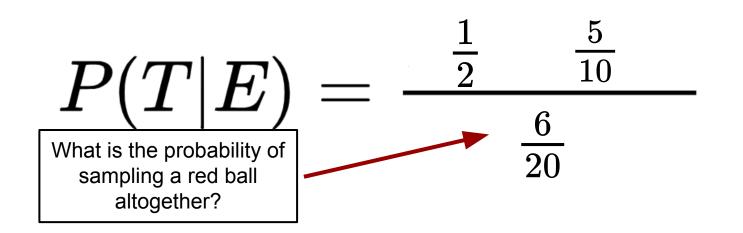

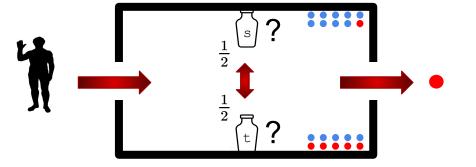

- = our player picked a red ball
 - = our player picked the 't' urn

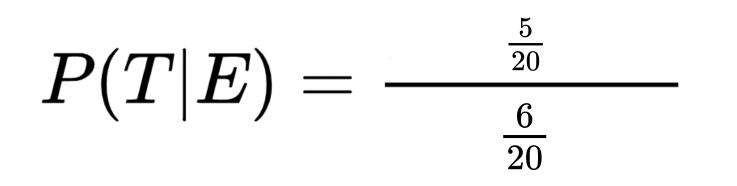

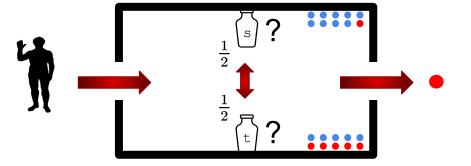

- = our player picked a red ball
- = our player picked the 't' urn

- = our player picked a red ball
 - = our player picked the 't' urn

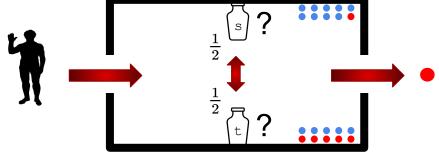

- $E \\ T$
- = our player picked a red ball
- = our player picked the 't' urn

Another way to visualize:

RED	RED	RED	RED	RED
RED	BLUE	BLUE	BLUE	BLUE
BLUE	BLUE	BLUE	BLUE	BLUE
BLUE	BLUE	BLUE	BLUE	BLUE

 $P(T|E) = rac{rac{5}{20}}{rac{6}{20}}$

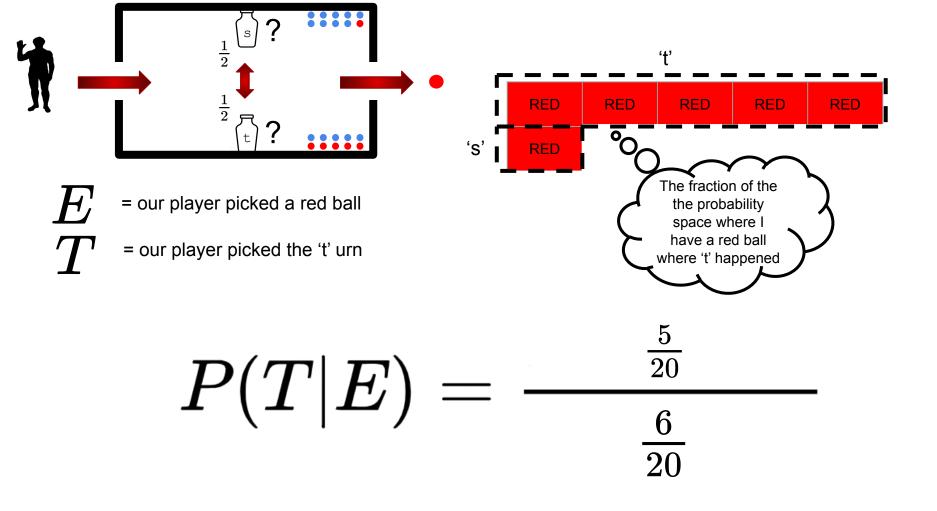

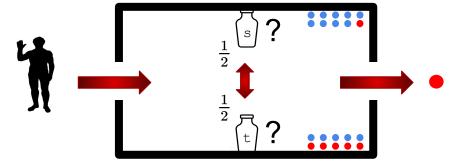

- $E \ T$
 - = our player picked a red ball
 - = our player picked the 't' urn

P(T|E)

Another way to visualize:

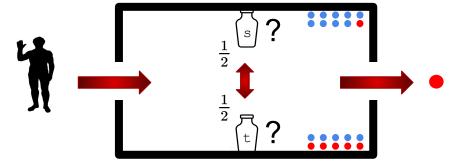

- = our player picked a red ball
 - = our player picked the 't' urn

$P(T|E) = rac{5}{6} pprox 83\%$

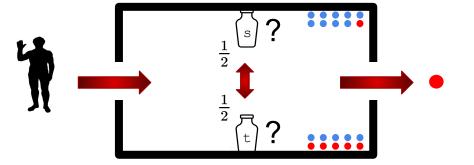

- = our player picked a red ball
- = our player picked the 't' urn

Let us think about Bayes' theorem a bit more...

- The color of the ball is an observation
- The urn that was selected is a piece of information I cannot have access to, a mental model
- I made a prediction about the probability of a model being correct given an observation

 $P(T|E) = rac{P(T)P(E|T)}{P(E)}$

Let us think about Bayes' theorem a bit more...

- The color of the ball is an observation
- The urn that was selected is a piece of information I cannot have access to, a mental model
- I made a prediction about the probability of a model being correct given an observation

 $P(M|D) = rac{P(M)P(D|M)}{P(D)}$

Let us think about Bayes' theorem a bit more...

- Say our player:
 - o selects an urn at random
 - \circ picks a ball
 - \circ records it
 - picks a ball again the **same** urn
- Our player does this 5 times
- When he leaves, he reports his observations

Observations 1:

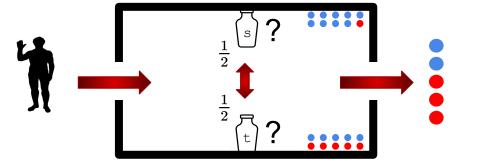

Let us think about Bayes' theorem a bit more...

- Say our player:
 - o selects an urn at random
 - \circ picks a ball
 - \circ records it
 - picks a ball again the **same** urn
- Our player does this 5 times
- When he leaves, he reports his observations

Observations 1:

What is the probability that urn 't' was selected? ~97%

key ideas:

- Additional independent observations can give us more confidence in a model being the correct one
- Confidence is never absolute

Observations 1:

What is the probability that urn 't' was selected? ~97%
