Functional Human Variation

Gabriel Renaud
Associate Professor
Section of Bioinformatics
Technical University of Denmark
gabriel.reno@gmail.com

Why is it important?

- Tay-Sachs is a genetic disorder
- Babies do not sit or crawl
- Followed by seizures, hearing loss
- Death occurs before 15
- The cause?

  4 bases out of 3,088,286,401 bases

http://www.curetay-sachs.org/

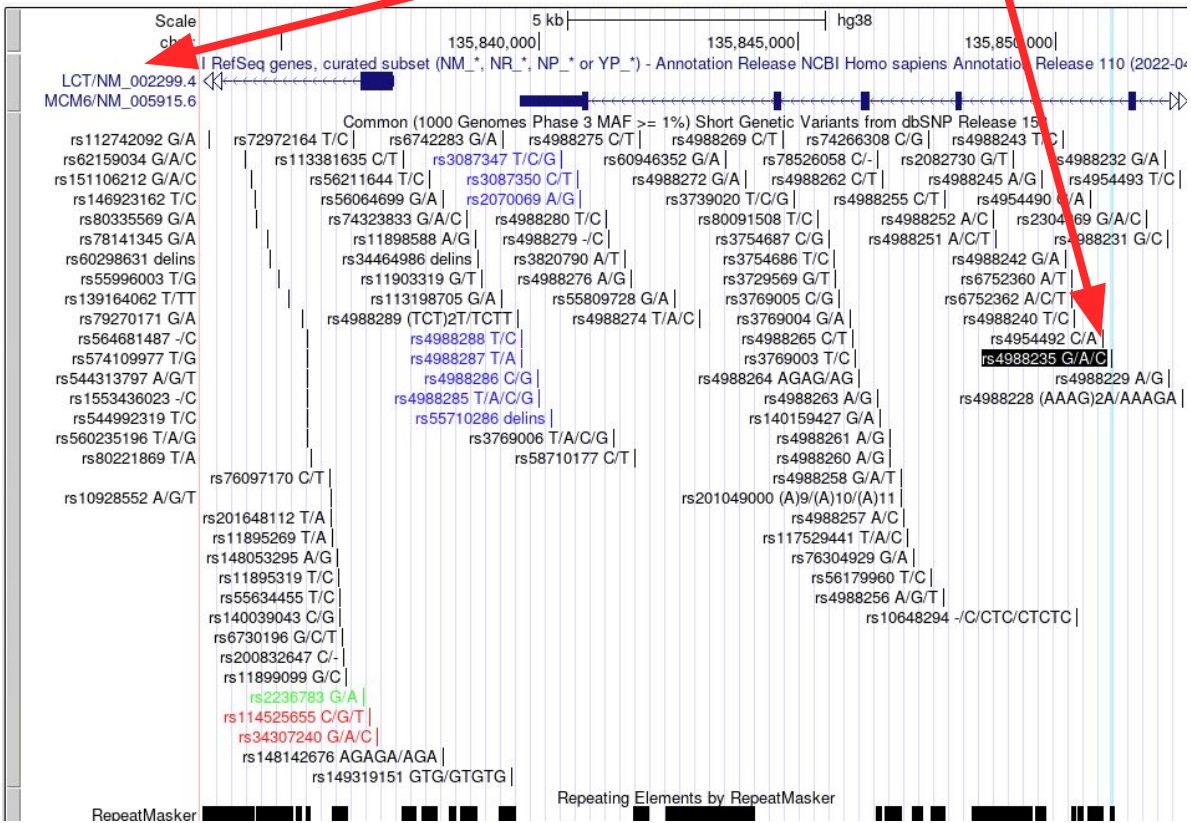
Got milk?

SORBET z MALIN
TRUSKAWKOWE
TIRAMISU
WANILIOWE
ŚLIWKA w CZEKOLADZIE

rs4988235 on chr2

genes:

SNPs:



rs4988235

Orientation minus
Stabilized minus

Geno	Mag	Summary
(C;C)	2.5	likely to be lactose intolerant as an adult
(C;T)	1.1	likely to be able to digest milk as an adult
(T;T)	1.1	can digest milk

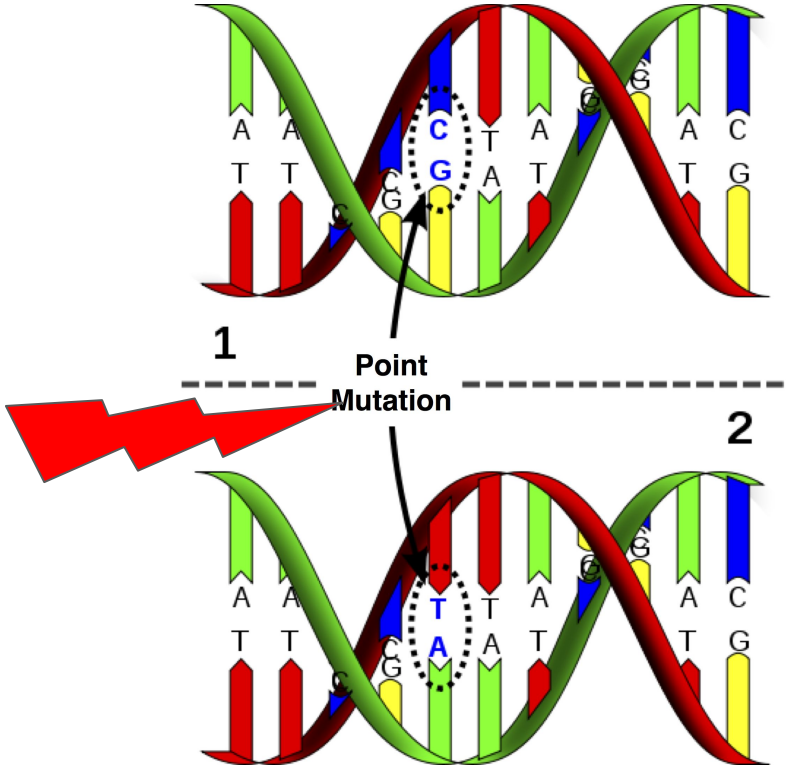
Variations: Mutations and Polymorphisms

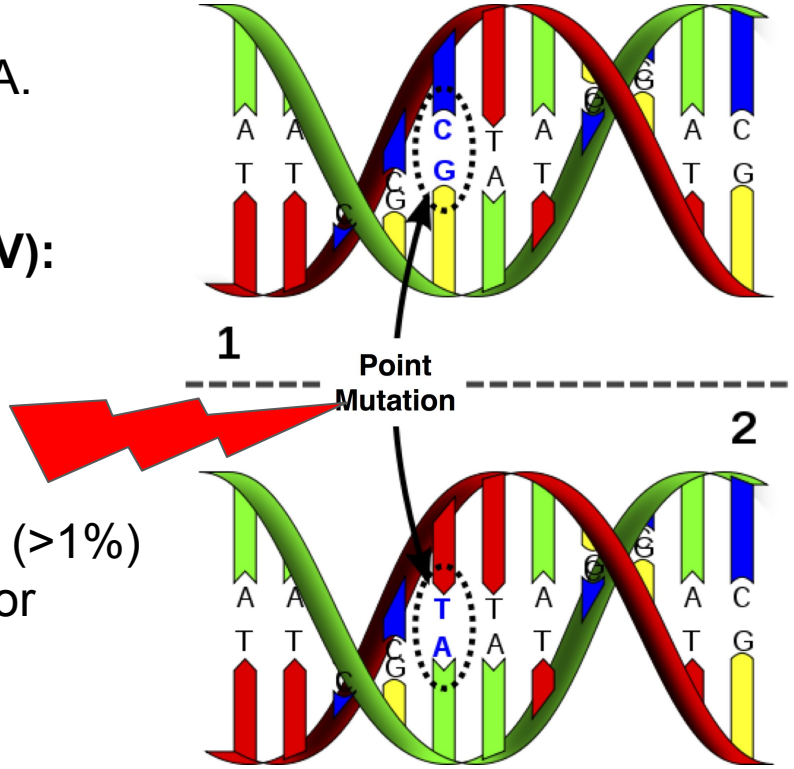


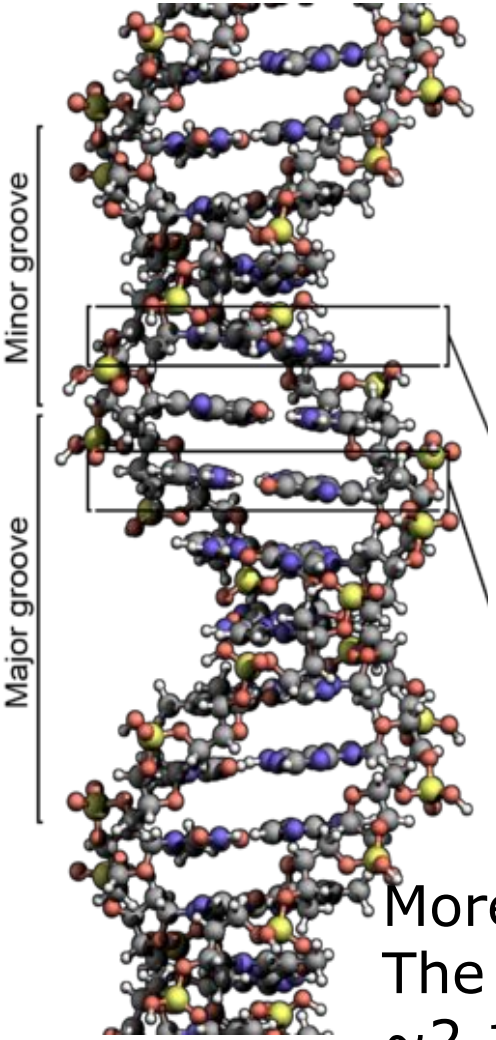
Variations: Mutations and Polymorphisms

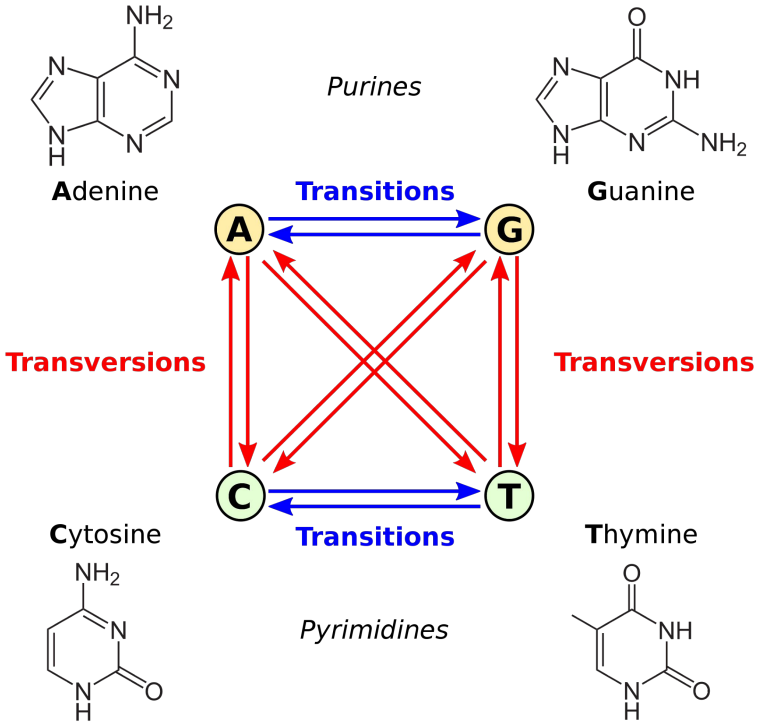
- Changes in the sequence of DNA.

Single Nucleotide Variation (SNV):
- single nucleotide is altered
- UV, chemicals, tobacco…

Polymorphism (SNP):
- Implies presence in population (>1%)
- Allele frequencies: Major / Minor





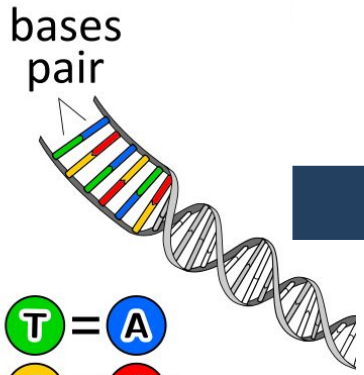


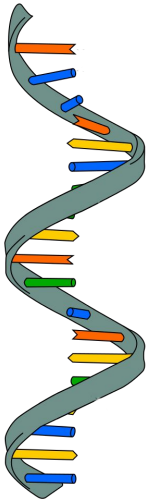
More transitions observed:

The transition/transversion ratio in human is ~2.1

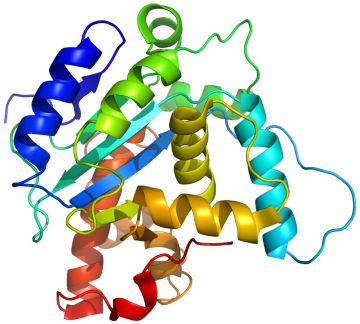
Why are mutations important?

DNA





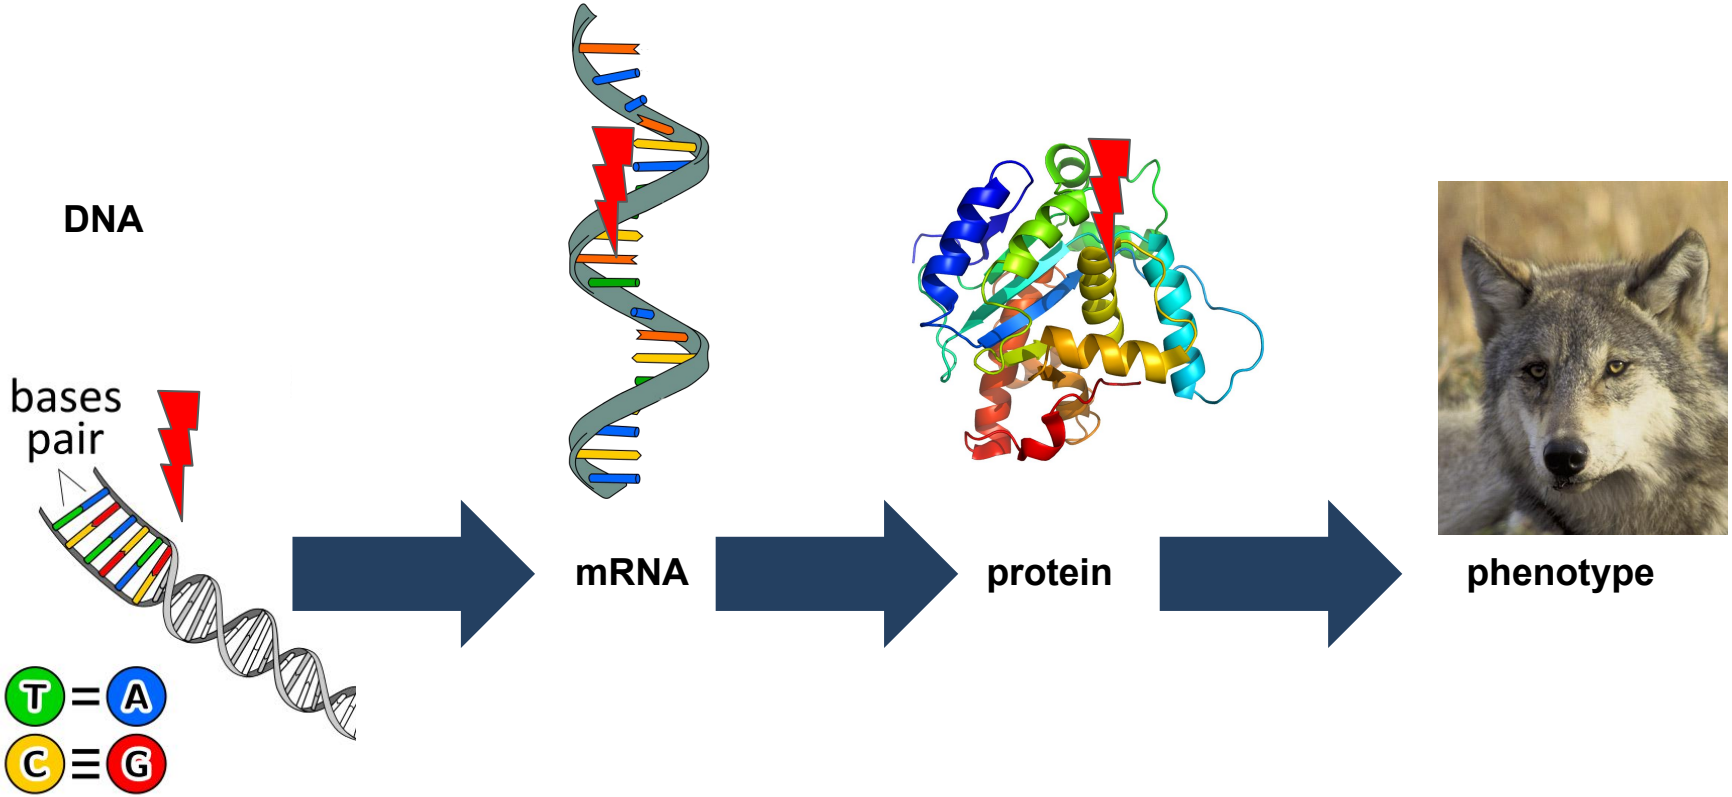
mRNA



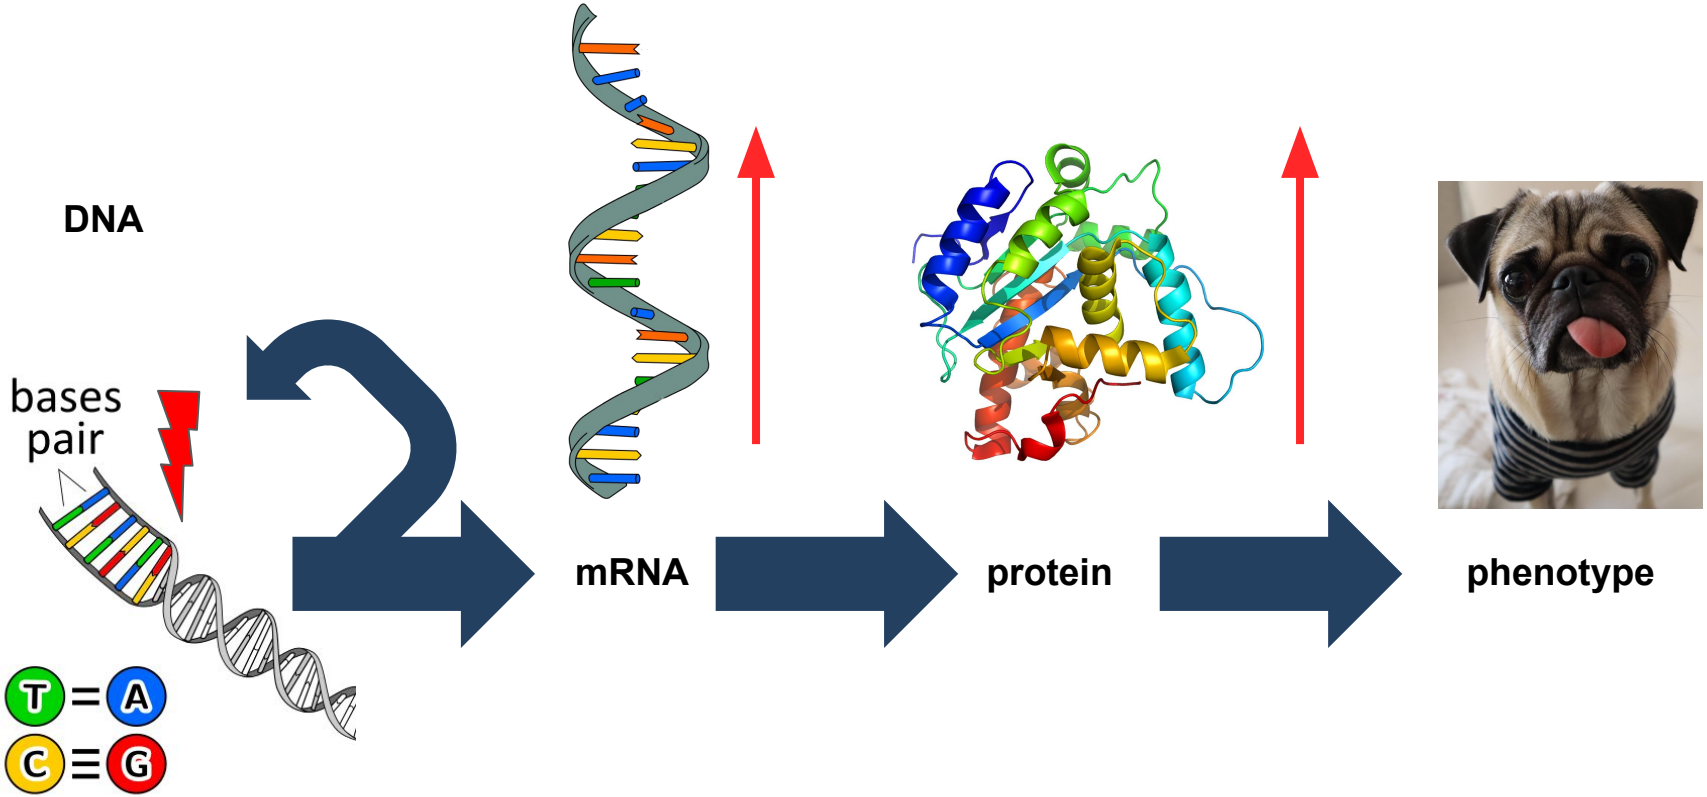
protein

phenotype

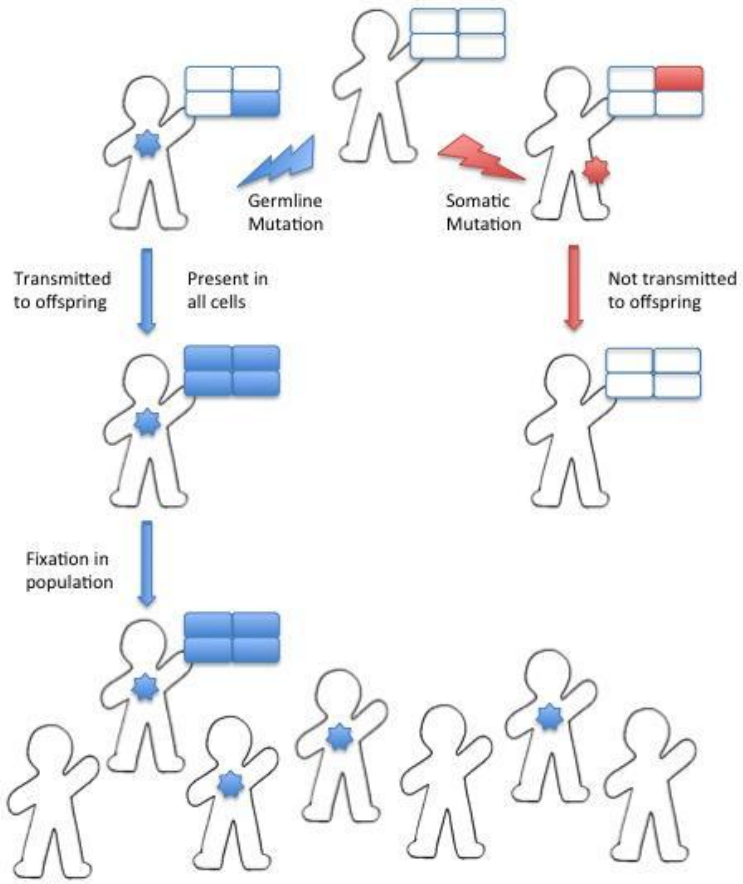
Change in the coding sequence



Change in the expression



Germline *vs* Somatic Mutations

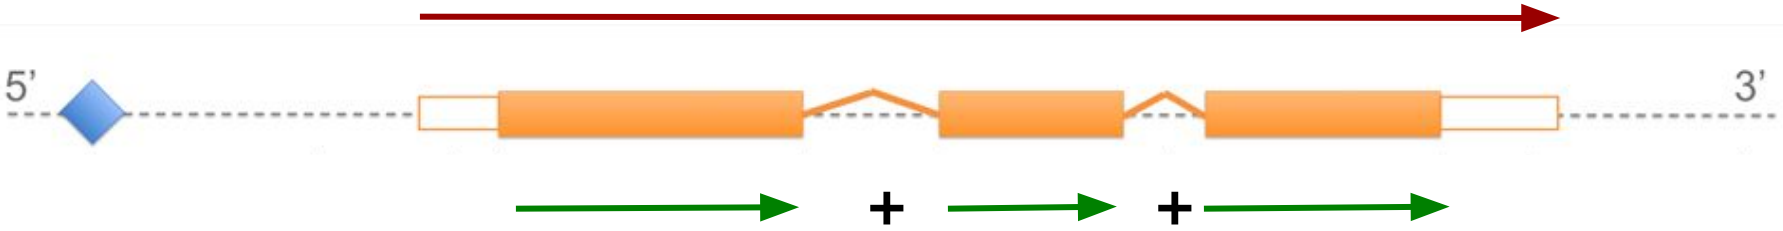


Germline Mutations
Present in **all** cells
Transmitted to offspring
Exists in population (SNP)

Somatic Mutations
-Present only in **some** cells
-Not transmitted to offspring
-Do **not remain** in population

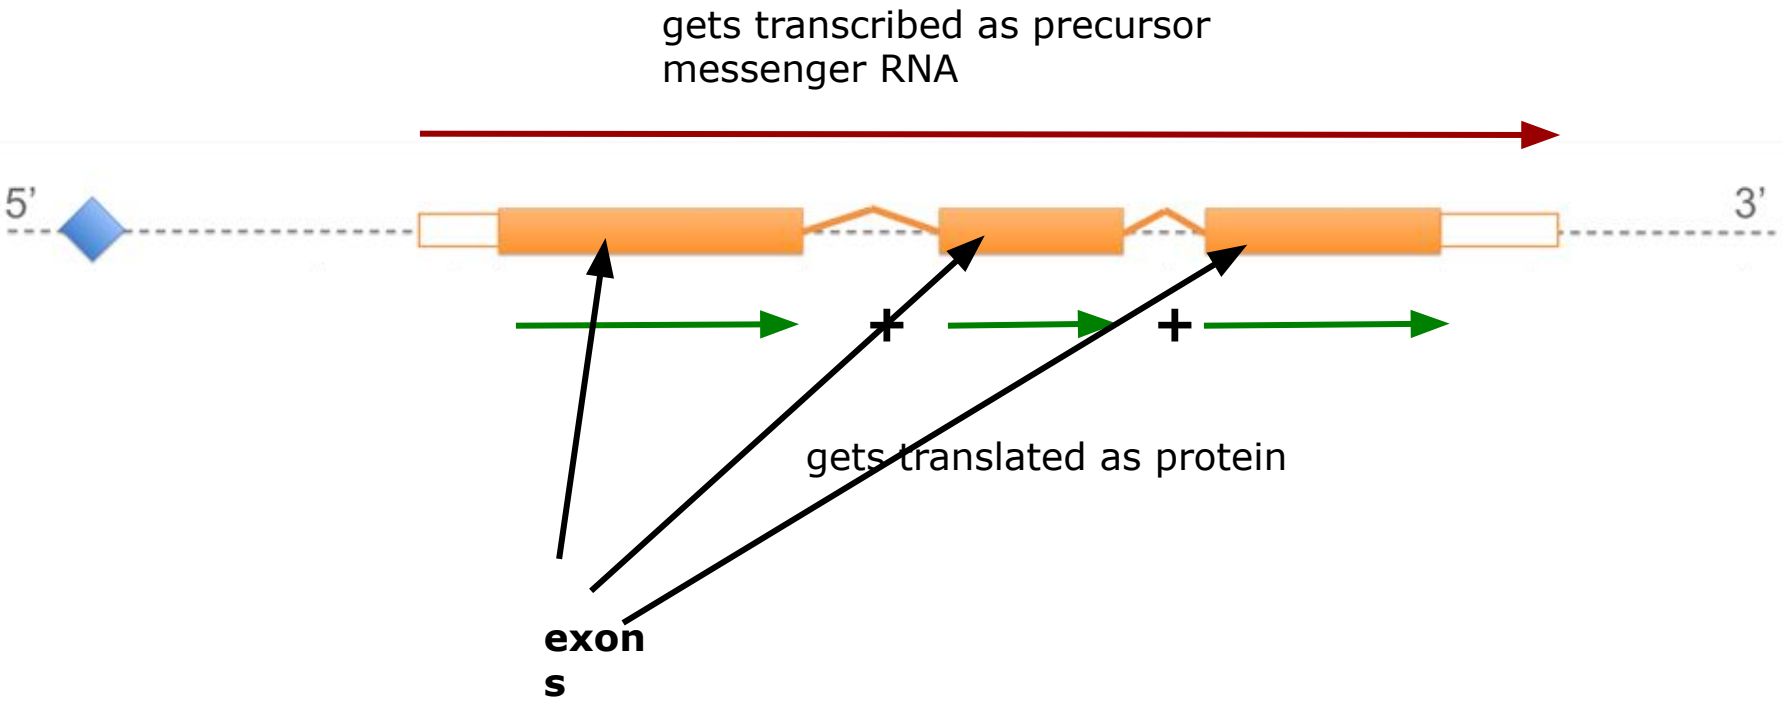
Some protein coding gene:

gets transcribed as precursor
messenger RNA

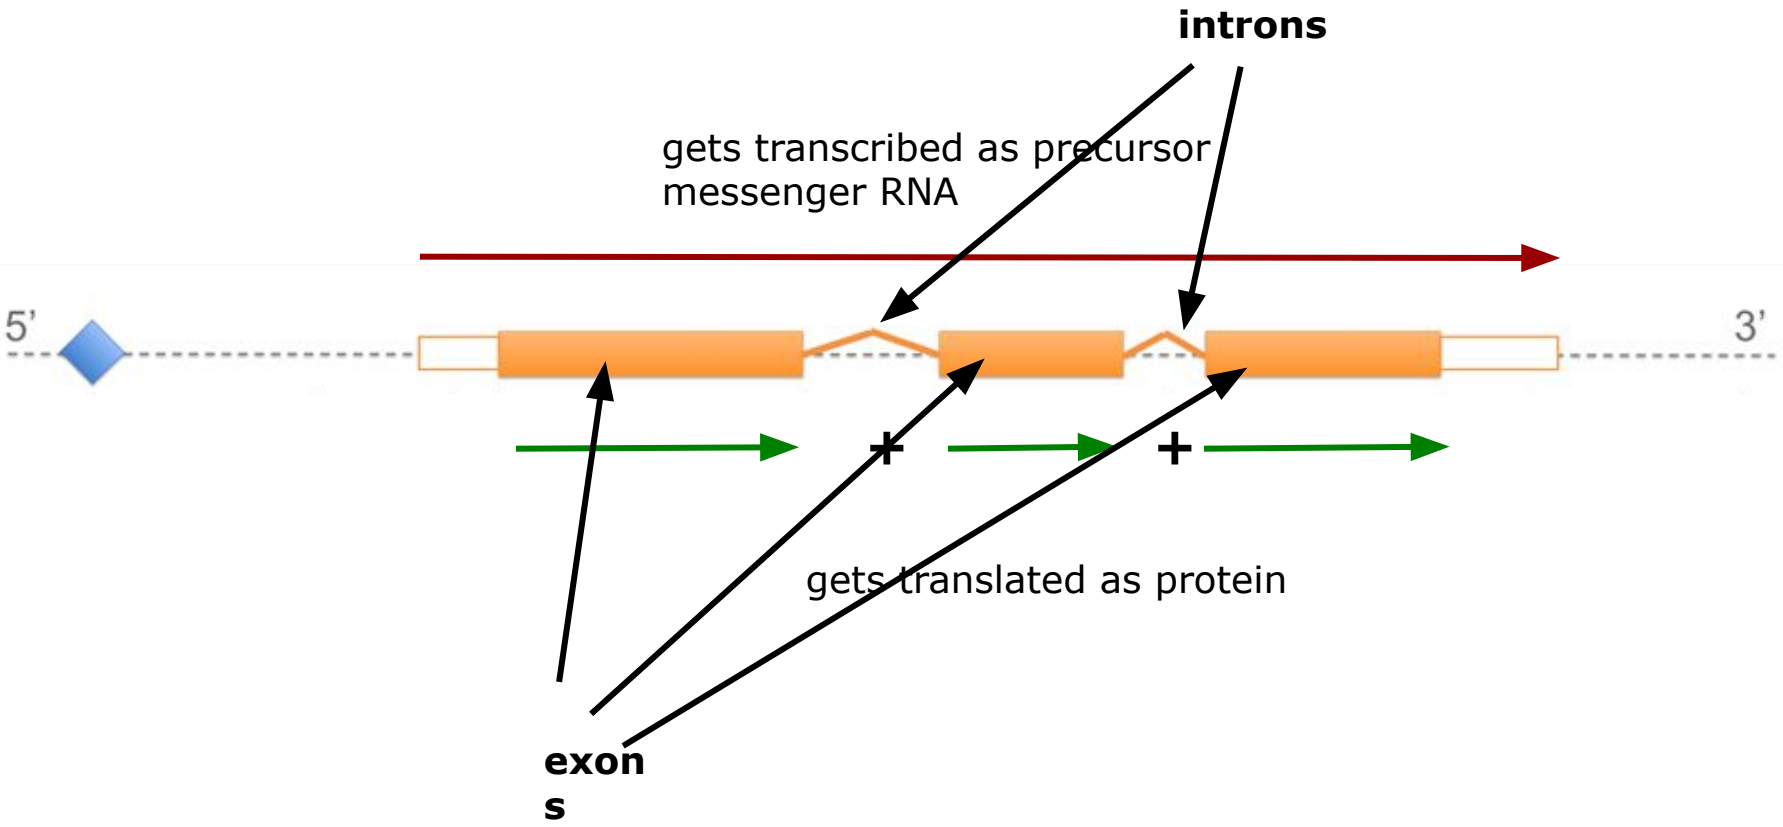


gets translated as protein

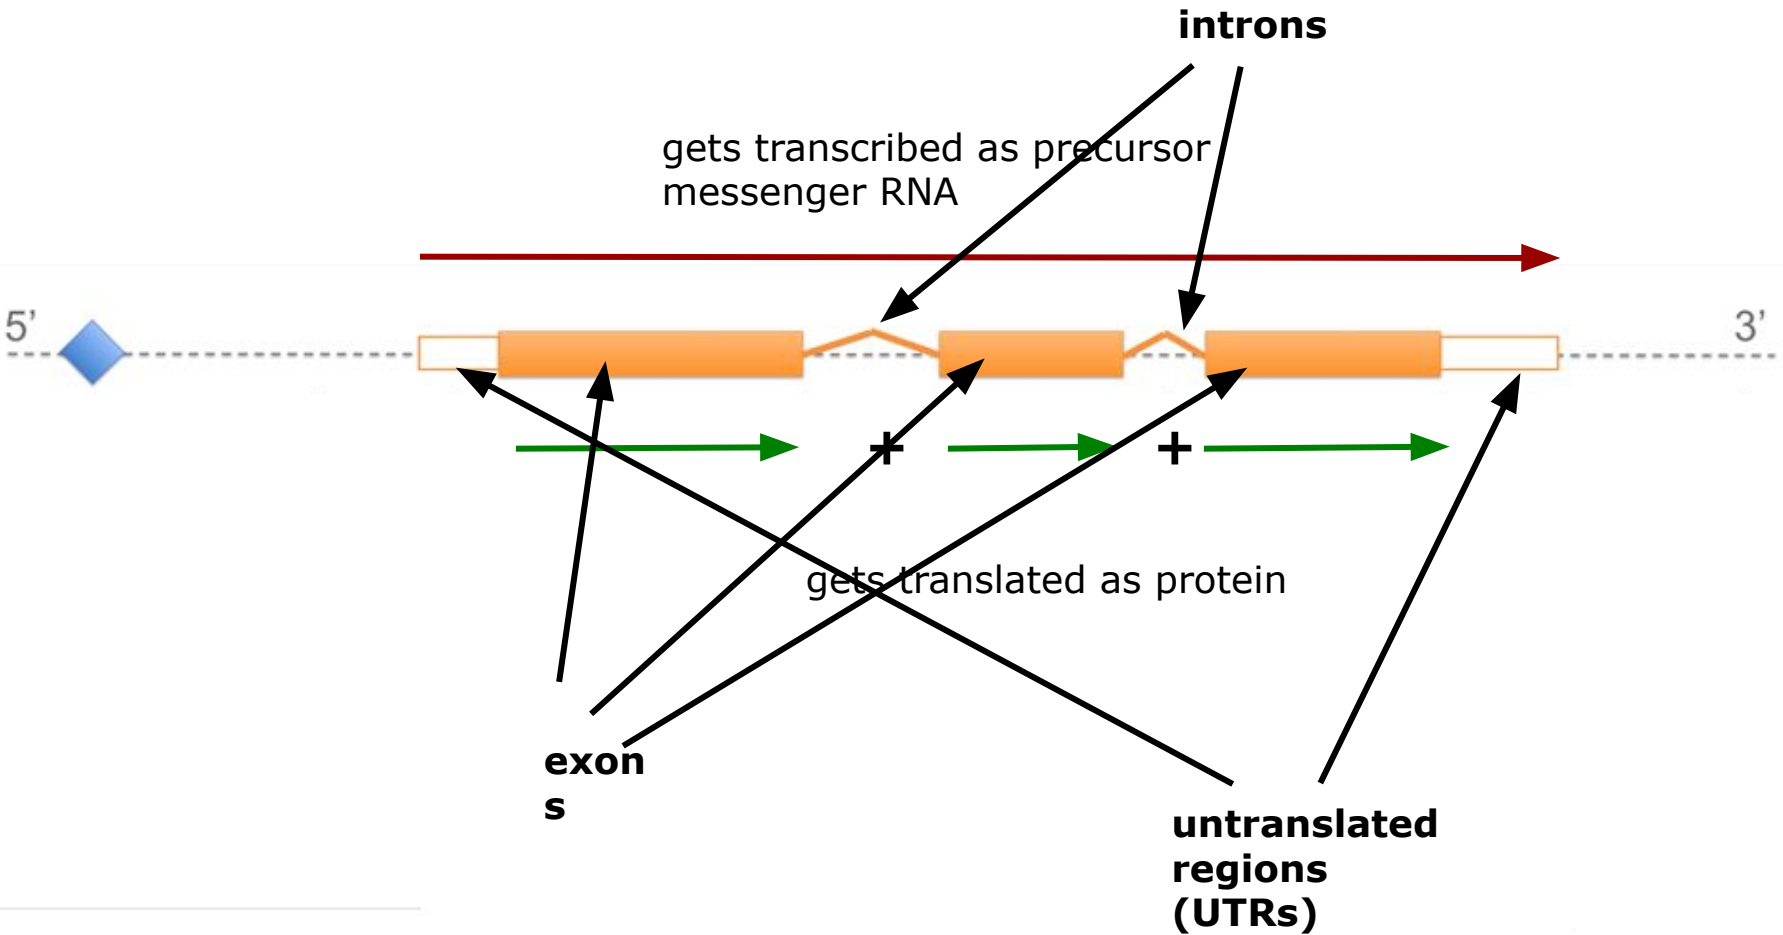
Some protein coding gene:



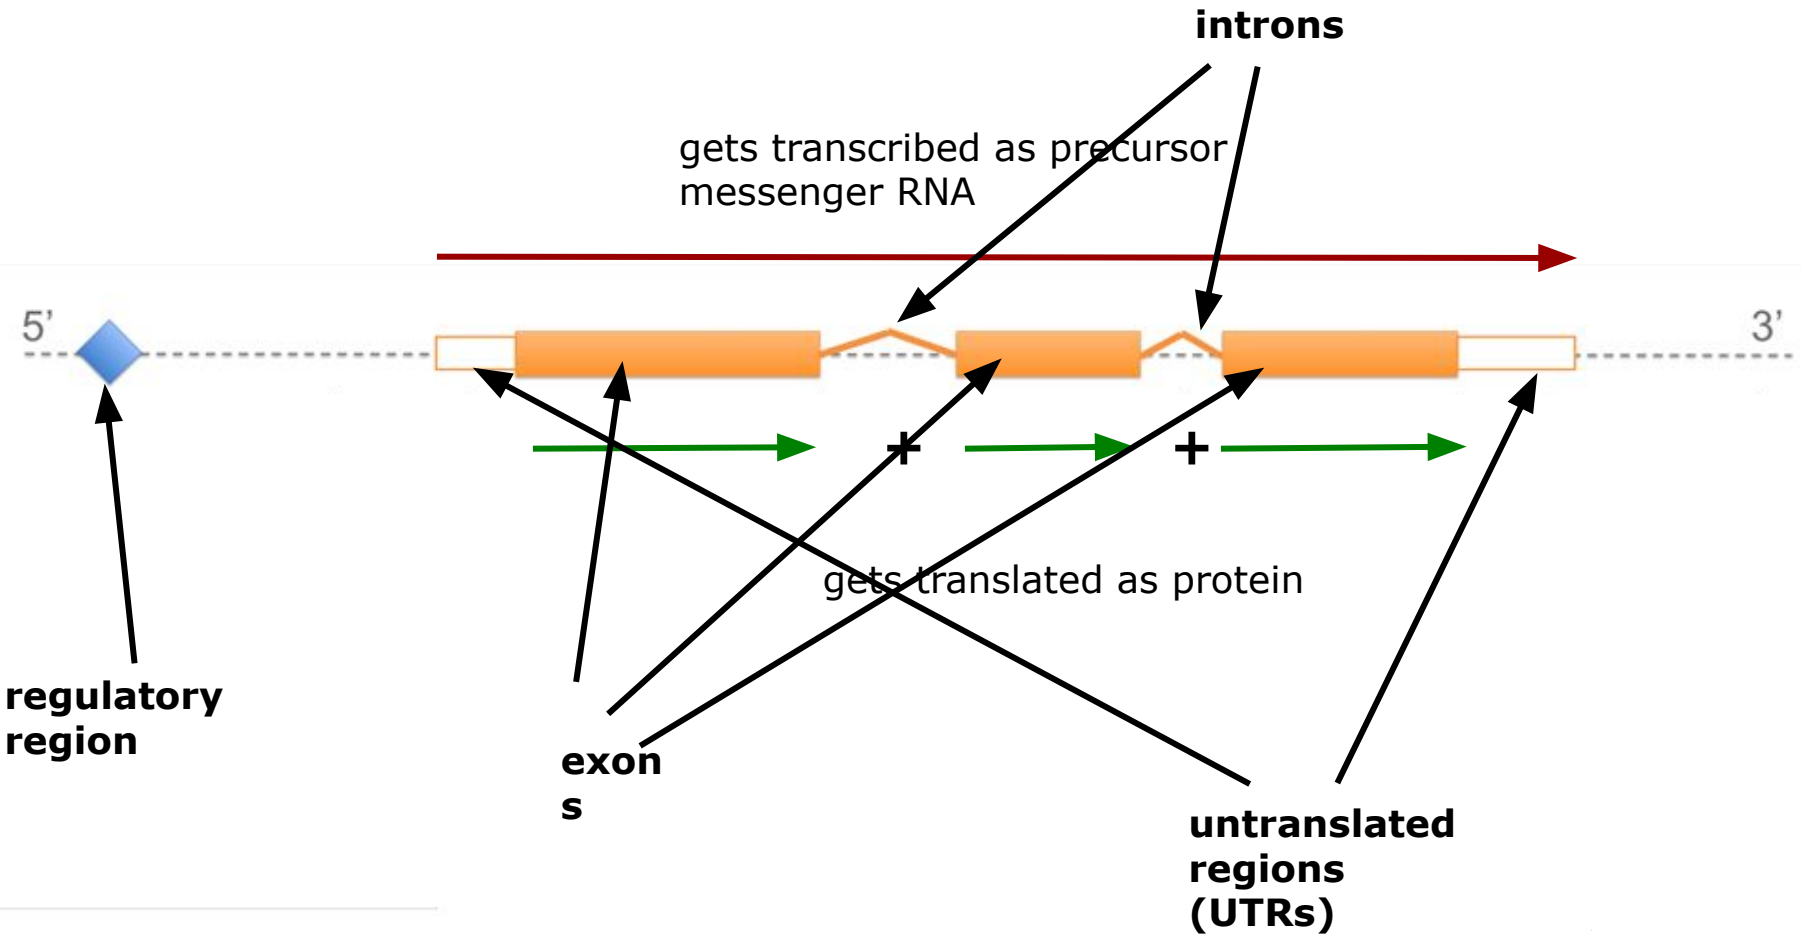
Some protein coding gene:



Some protein coding gene:

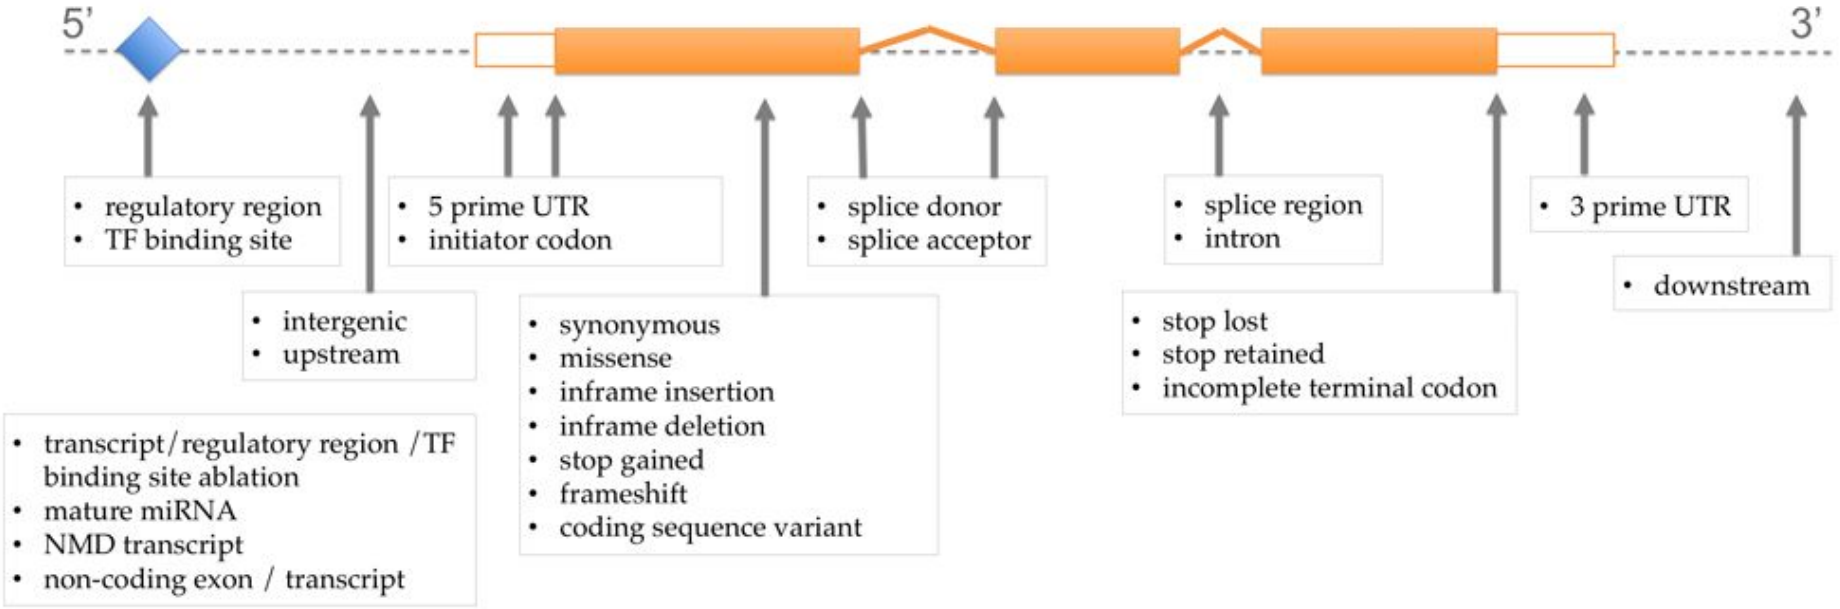


Some protein coding gene:

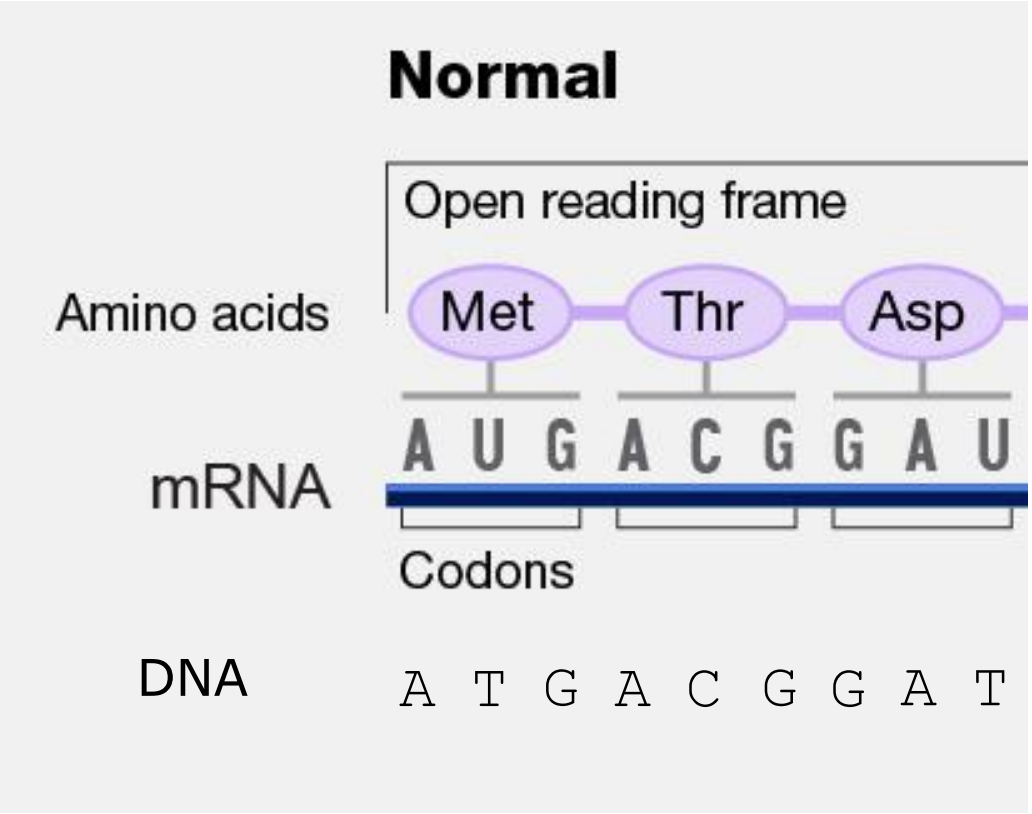


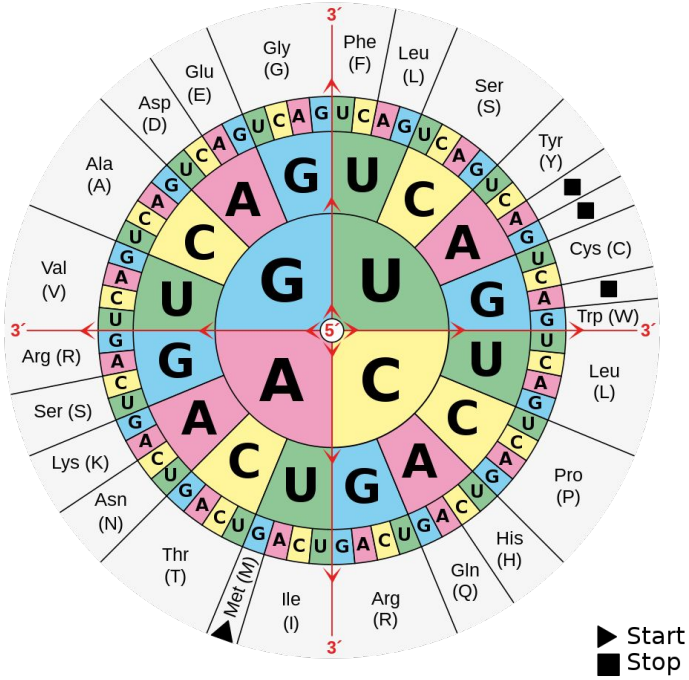
Coding *vs* Non-Coding variations

- There are different regions in the genome
- Mutations in different regions will have different consequences



RNA codons





source: genome.gov

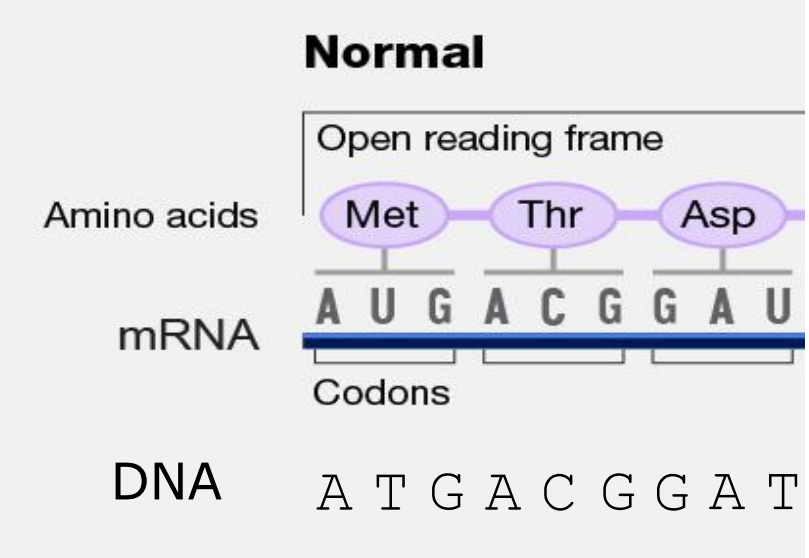
Consequences of coding mutations

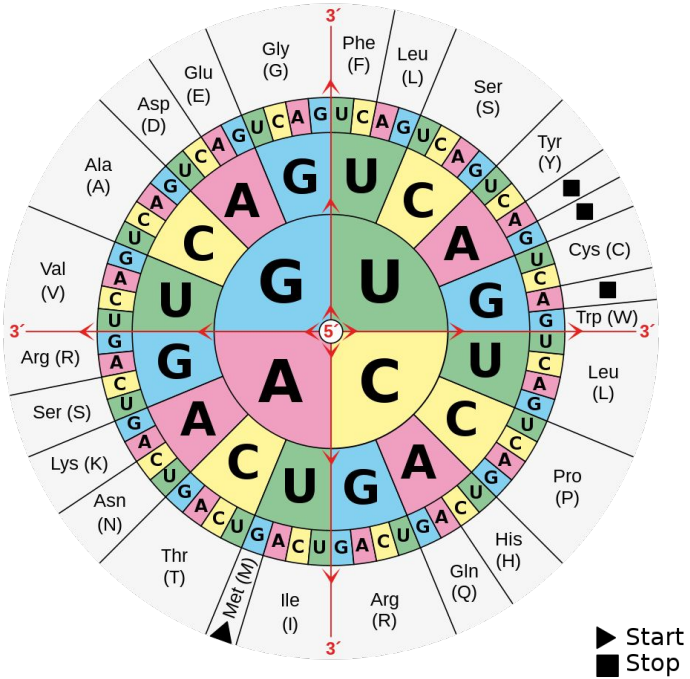
Silent

ACG -> ACA

Threonine

Threonine





source: genome.gov

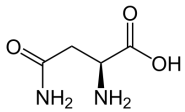
Consequences of coding mutations

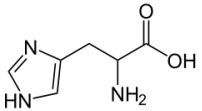
Degeneration of the genetic code

Non-Synonymous (missense)

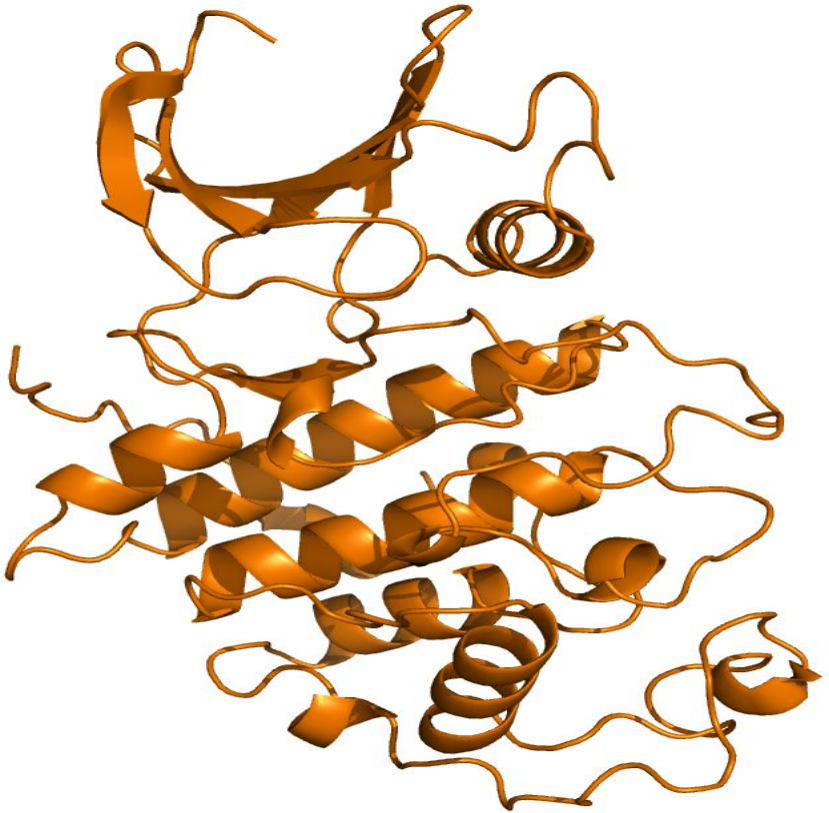
AAC -> CAC

Asparagine Histidine

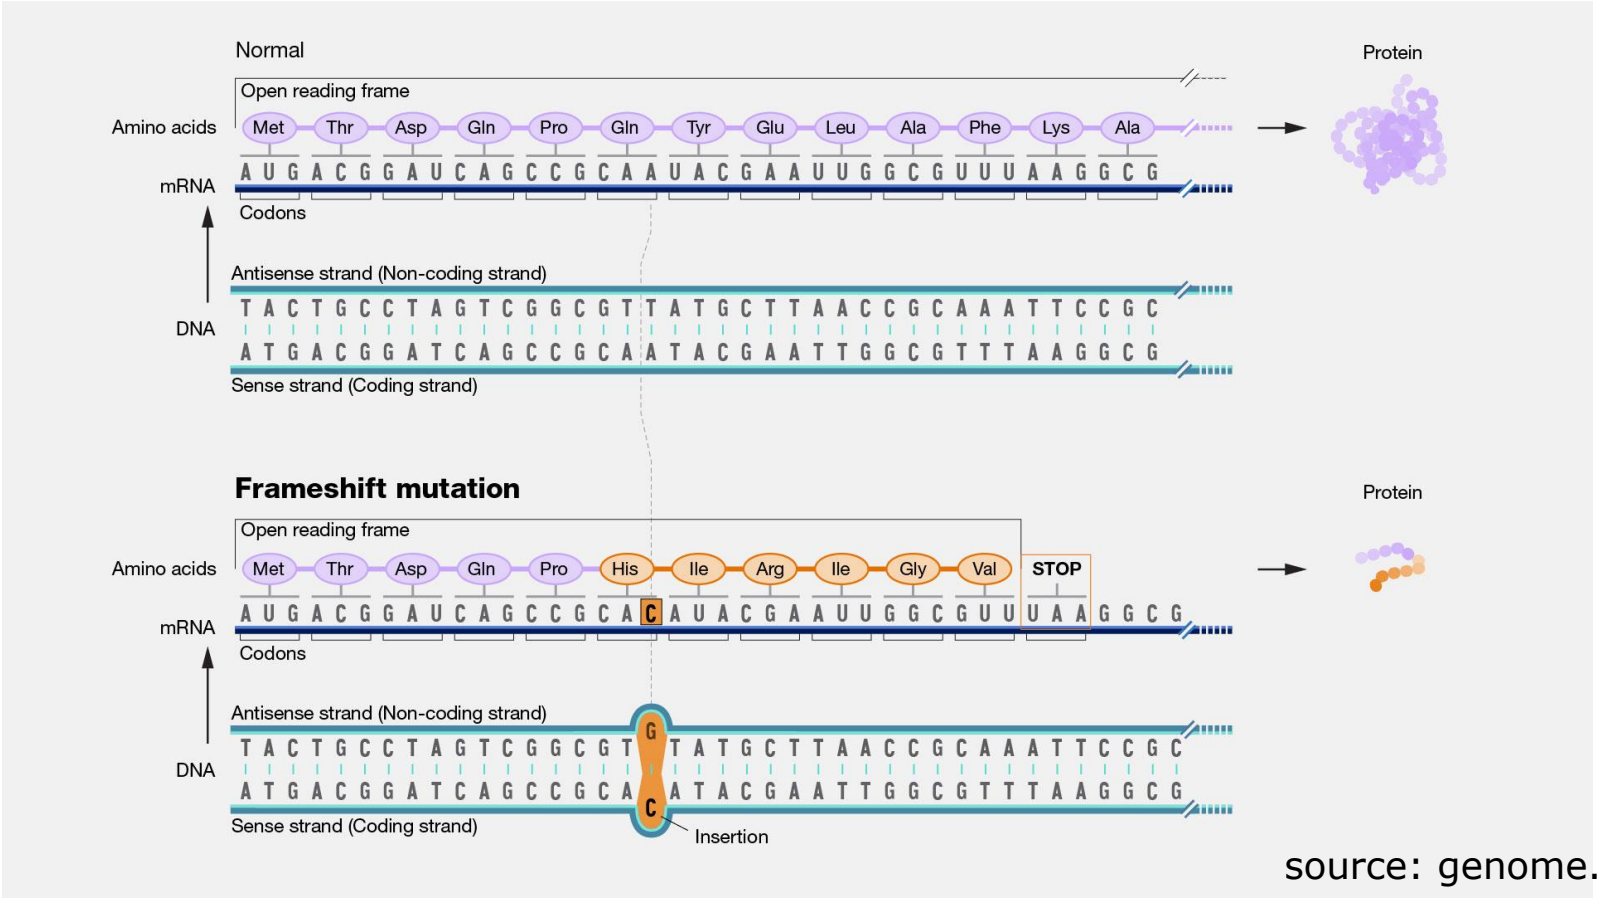




- Different chemical properties
- Altered protein structure

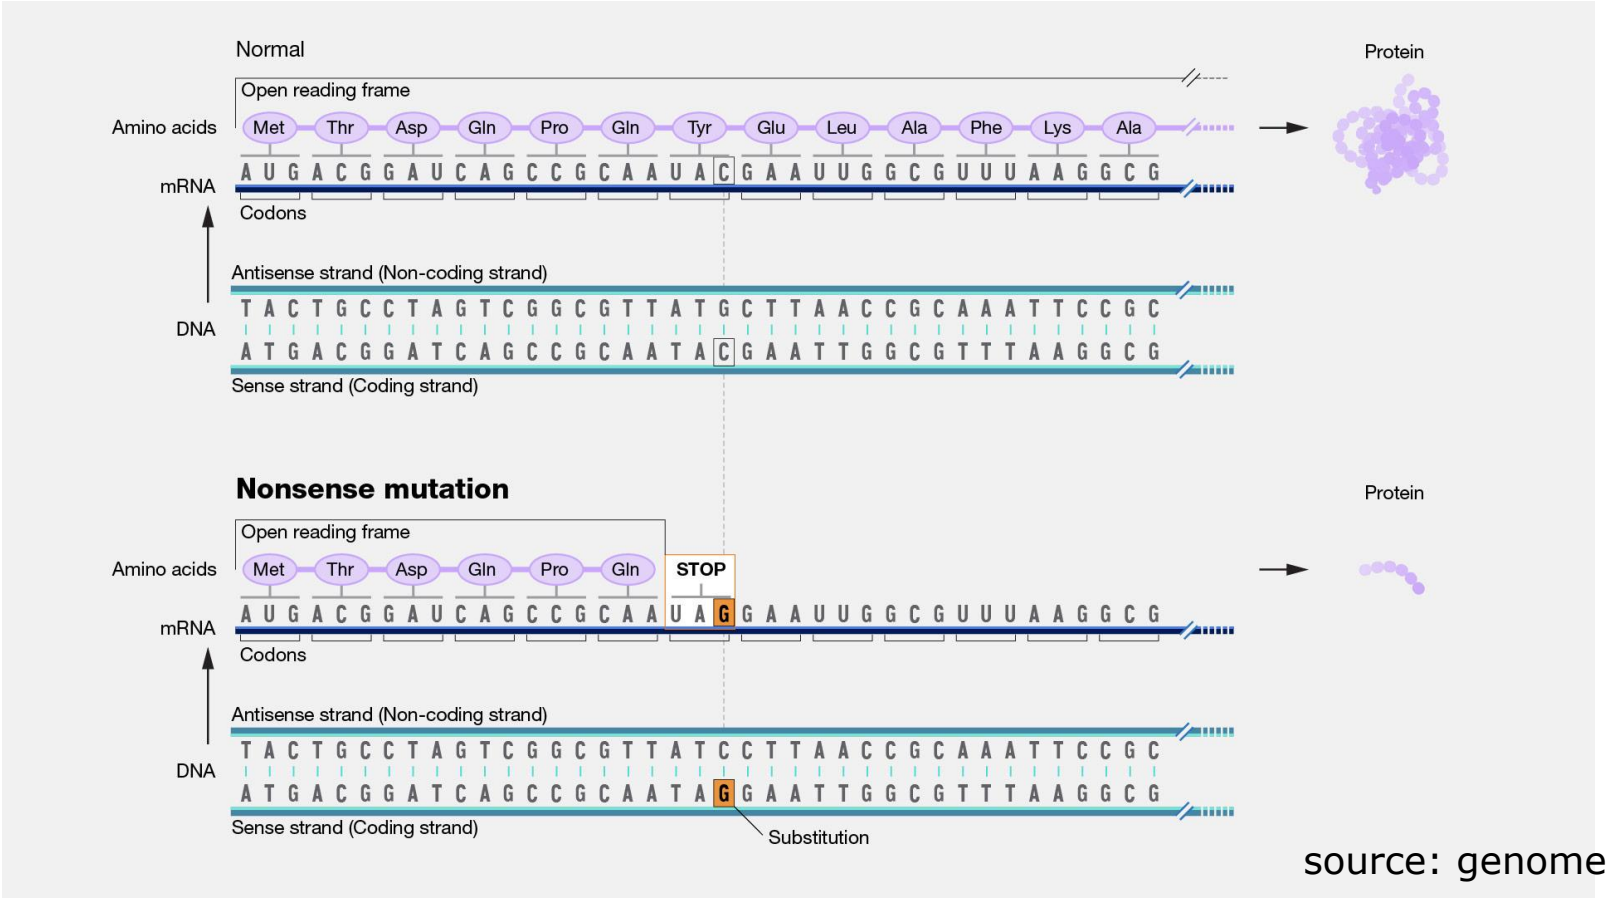


Consequences of coding mutations



source: genome.gov

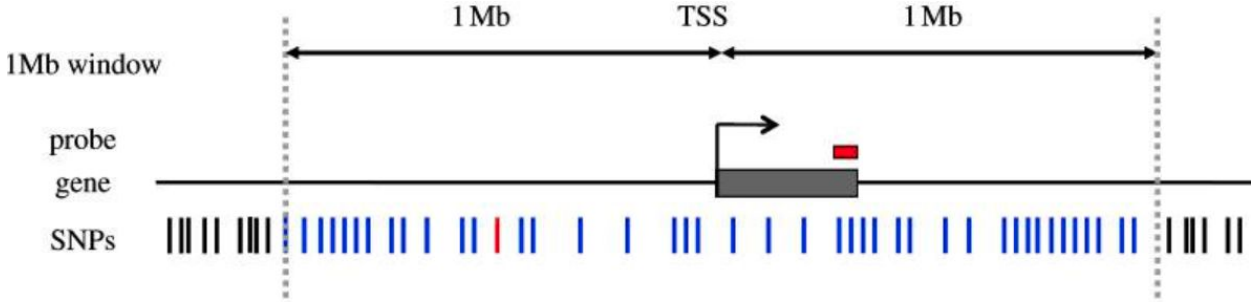
Consequences of coding mutations

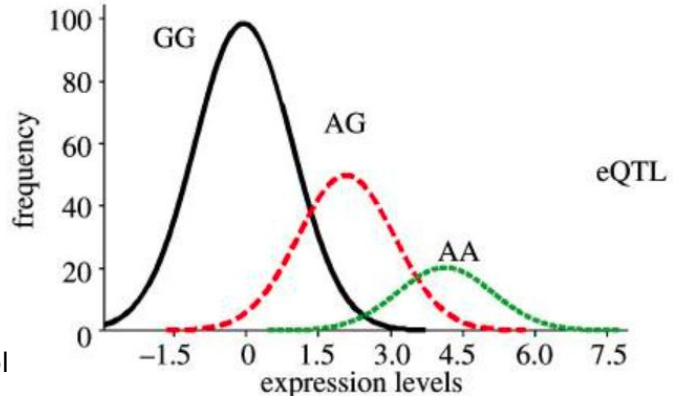


source: genome.gov

Consequences of non-coding mutations

1) change in expressions



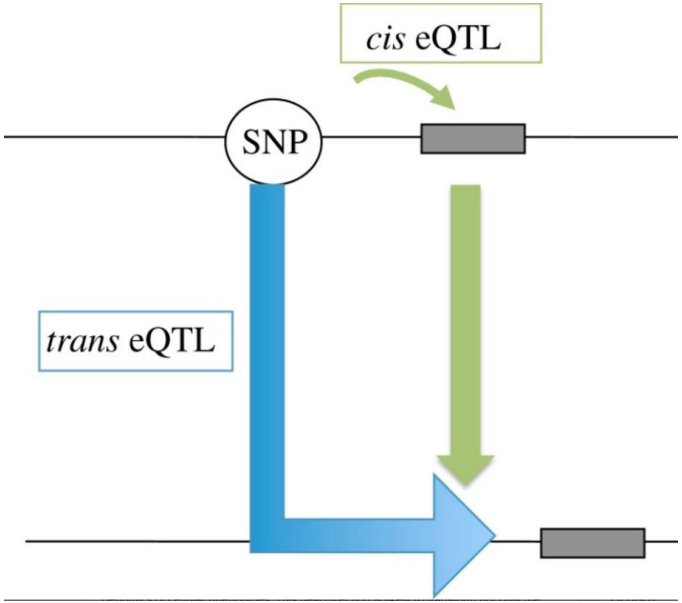


eQTL = **E**xpression **Q**uantitative **T**rait **L**oci = locus responsible for a fraction of the genetic variance of a gene expression phenotype

Nica AC, Dermitzakis ET. Expression quantitative trait loci: present and future. Philos Trans R Soc Lond B Biol Sci. 2013 May 6;368(1620):20120362. doi: 10.1098/rstb.2012.0362. PMID:

Consequences of non-coding mutations

1) change in expressions

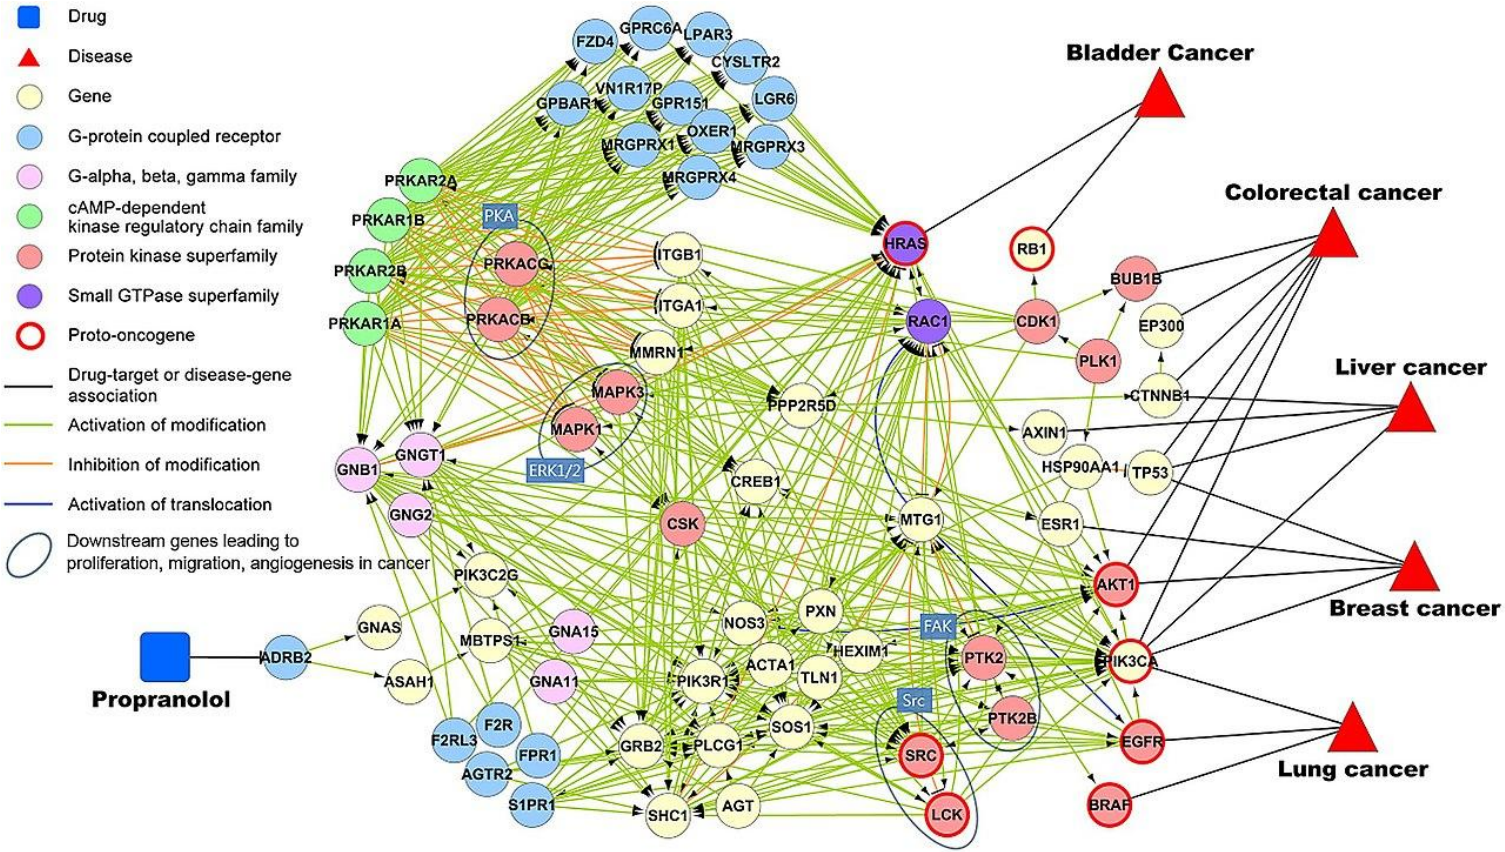


eQTL (expression quantitative trait loci)

locus responsible for a fraction of the genetic variance of a gene expression phenotype

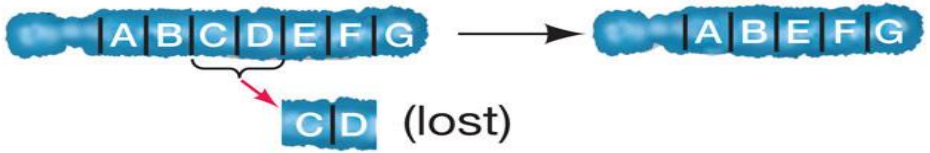
Nica AC, Dermitzakis ET. Expression quantitative trait loci: present and future. Philos Trans R Soc Lond B Biol Sci. 2013 May 6;368(1620):20120362. doi: 10.1098/rstb.2012.0362. PMID:

Consequences of mutations…. it's not easy.

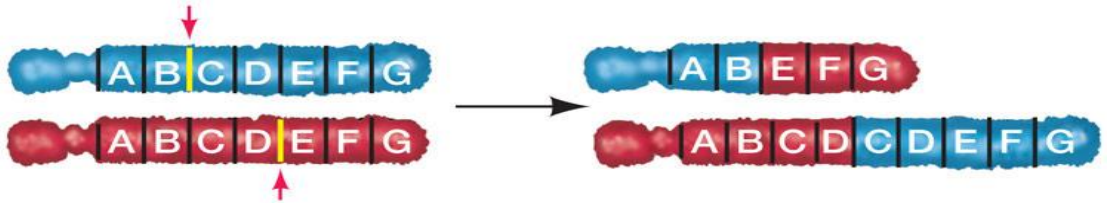


Chromosomal rearrangements

Deletion/Insertion



Deletion + Duplication:

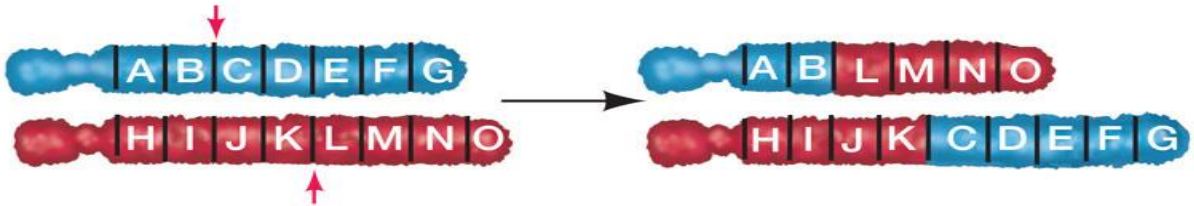


(LIFE 10e, Figure 15.4)

Chromosomal rearrangements

Inversion

Translocation:



(LIFE 10e, Figure 15.4)

Conservation and mutations

The mutation of which position looks more pathogenic?

Are there amino acids better tolerated than other in (red) position?

And what about the position in (green)?

(Ng, 2001)

SIFT: Pathogenicity of mutations

- SIFT is based on amino acid conservation across species
- Mutation of highly conserved ☐ Pathogenic
- http://blocks.fhcrc.org/sift/SIFT.html
- Pathogenic if **SIFT score < 0.05**

(Ng, 2001)

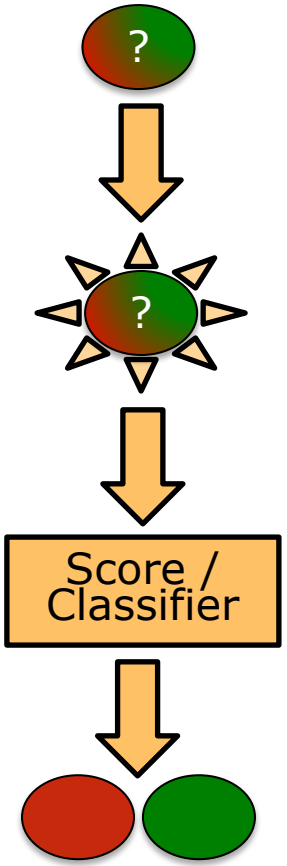
Methods to predict pathogenicity

2001 – SIFT, SNP3D-stability
2002 – Polyphen
2003 – Panther
2004 – PMUT, PFAM LogRE
2005 – LS-SNP, SNP3D-seq

2007 – SNAP, CanPredict, SAPRED
Torkamani (Kinases)

2009 – SNPs&GO
2010 – Polyphen-2, MuD

2012 – KinMut (Kinases)
2013 – NetDiseaseSNP



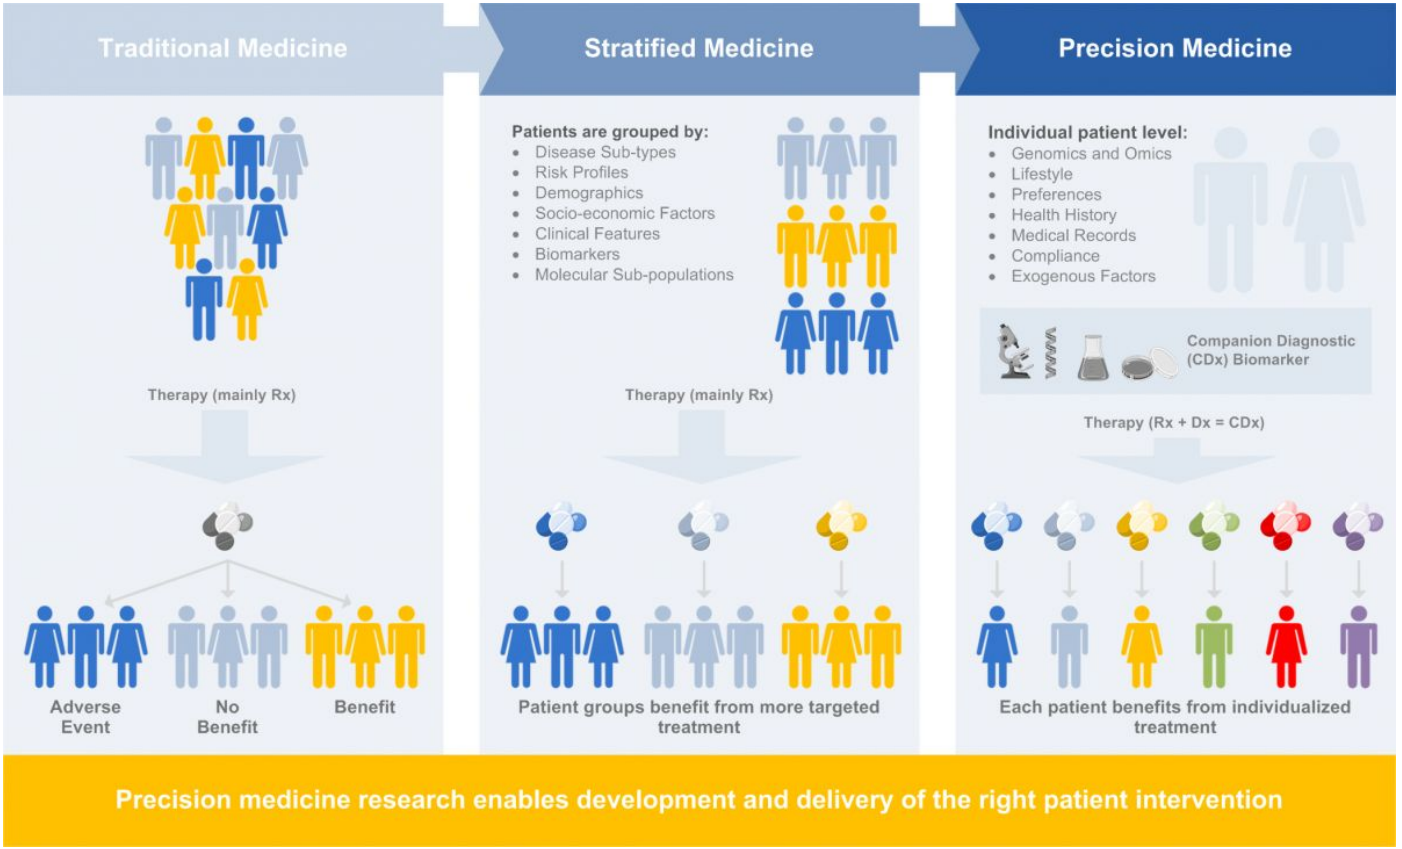
Novel Mutation

Features Added

Prediction of Pathogenicity

Pathogenic or Neutral Mutation

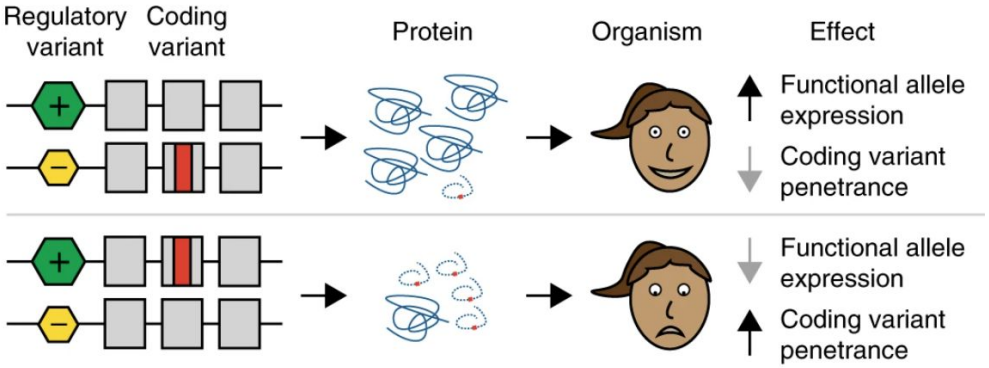
The future: Personalized/Stratified medicine



The future: Personalized/Stratified medicine

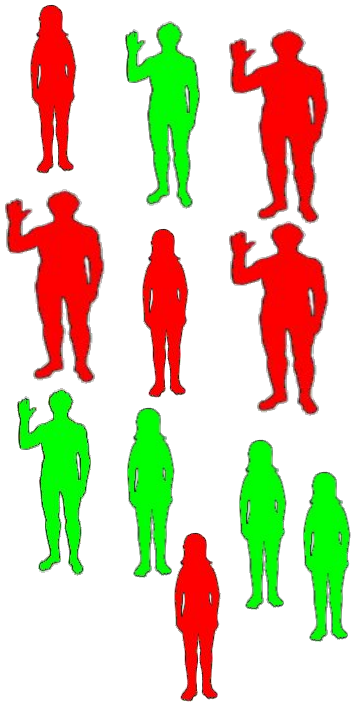
Hurdles to personalized medicine:

- no 1 mutation -> 1 gene
- rare variants
- variants on the same chr vs different: haplotypes



Castel, S.E., Cervera, A., Mohammadi, P. *et al.* Modified penetrance of coding variants by cis-regulatory variation contributes to disease risk. *Nat Genet* 50, 1327–1334 (2018). https://doi.org/10.1038/s41588-018-0192-y

The future: Polygenic risk scores

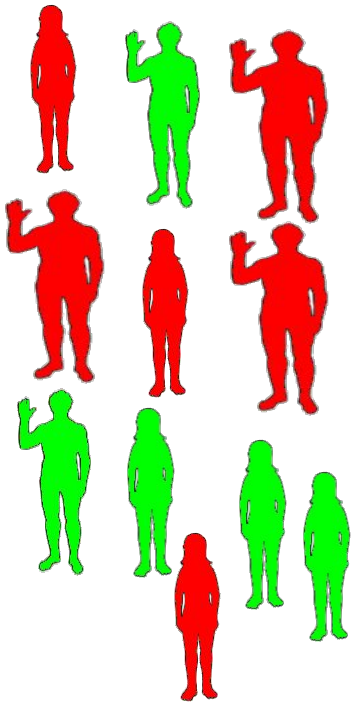


High risk for disease X

High risk for disease Y

The future: Polygenic risk scores

$$PRS = w_1 SNP_1 + w_2 SNP_2 + w_3 SNP_3 + \ldots$$



The future: Polygenic risk scores

$$PRS = w_1 SNP_1 + w_2 SNP_2 + w_3 SNP_3 + \ldots$$
