Biofilm comparison

Aims

This study aims:

- (i) to find potential bacterial lineages using culture based method and confirm with Biolog GEN III PCR.
- (ii) to investigate the bacterial profiles of communities in two biofilm samples NGS.

Biofilm comparison

Sampling

The samples were harvested by scraping of 10 cm² from inner surface of pipes using sterile cotton swabs. Swabs were submerged into tubes each one containing 10 mL sterile water and homogenized by using vortex agitator for 5 min¹⁰. Then, it was preserved in ice box and immediately transferred to lab for analyses according to APHA (American Public Health Association).

Biofilm comparison

Results

- Proteobacteria is the most important group (Operational Taxonomic Group)
- Kitchen biofilms have higher OTG diversity than bathrooms
- Metal surfaces have higher biofilm accumulation
- A range of diversity results.

Biofilm comparison

Research questions

- Which sink/surface contains the most dangerous microbes?
- How does the frequency/style of bathroom cleaning affect microbiome?
- Do the type, age or material of the drain, flat floor, distance to other drains matter?
- Does the type of personal care products used matter?
- How does the human composition of the household affect diversity?
